Leitz Lexicon

Edition 7

Dear customer,

For decades, Leitz tool solutions and services has guaranteed our customers sustainable success and competitiveness in the processing of wood, wood derived materials and innovative materials. As a world market leader, we set trends and develop highly efficient tools through innovative ideas and the most advanced technology. Leitz supplies solutions with vision, making production processes not only faster, more flexible and cost-effective, but which combine ecology and economy with excellent processing quality. This current seventh edition of the Leitz Lexicon also reflects our performance promise; that your business succeeds with the support of our products and services.

Sustainability, flexibility, quality, productivity and efficiency as well as suitability and reliability are subjects that are always in focus for Leitz as a company, and our tools, tooling systems and services. The Leitz Lexicon has underlined this for decades. With a new layout and user-oriented structure, we present you the whole world of our total tool know-how.

The increase in networked production processes is vital in the era of Industry 4.0. Along the entire value chain, intelligent tools assume an important and forward-looking role as an information medium. Each element of the process chain plays an important role, however, as we realized decades ago, as a shaping and quality-relevant element on the workpiece, the tool has exceptional functions.

Over more than 140 years of tradition and as a family enterprise in its fifth generation, the satisfaction of our customers - from small craft enterprises to global industrial companies - continues to be our main priority. As a manufacturing service provider and expert partner, with our worldwide net of wholly-owned sales and service companies, we have a centre near you providing expert support, along with highly qualified staff that undergo continual training.

With this new, compact edition of the Leitz-Lexicon, we provide you our comprehensive process and tool know-how so we can do our part for your economic success. We are glad to offer solutions in new dimensions.

Together, we will shape a successful future.

Yours sincerely

Dr. Cornelia Brucklacher
Head of the Advisory Board
and shareholder

Jürgen Köppel
Spokesman of the Management

Leitz was founded in Oberkochen, Southern Germany in 1876. Precision tools and tooling systems developed and produced in house, meet the needs of the woodworking and plastic machining industries, Tooling plus complex tool services make Leitz a reliable partner for both industry and craft. Today Leitz is a global player with production plants, sales companies and service centres in 36 countries.

Leitz Group

Leitz GmbH & Co. KG, with its headquarters in Oberkochen, Baden-Württemberg, Germany is a technological leading manufacturer of precision machine tools and tooling systems for industrial processing of solid wood, wood derived materials and plastic materials. In addition to a comprehensive product program, Leitz offers consultancy services using the company's 140 plus years experience of supplying tools to its customers.

Leitz: facts and figures

The Leitz Group has 6 production facilities in Europe, America and Asia. The employees at Leitz design, make and deliver over 8000 precision tools from the standard tool program, in addition to tooling systems and numerous customer specific tools.

With many subsidiaries and over 120 service centres around the world Leitz is always close to the customer. Supported by local stocking Leitz delivers products quickly and reliably in over 150 countries and offers qualified consultancy support, and fast tool maintenance.

Leitz: a producing service provider

Leitz has, at the head office in Oberkochen and at the subsidiaries in Unterschneidheim, Germany and Riedau, Austria, in-house research and development centres. There Leitz engineers work closely with customers and leading machine manufacturers to develop and test innovative and efficient machining and tooling solutions.

Leitz also co-operates closely with the renowned research institutes and universities to offer the best tooling solution to its customers. Optimised performance, reduced processing costs and consideration of the environmental impact of the machining solutions are three of the priorities for research and development at Leitz.

Leitz supplies much more than a special range of products: Leitz is a service provider; the product spectrum encompasses the entire range of precision machine tools for global industrial organisations and craftsman's shops in the wood and plastic processing industries and are, for example, used in window, timber construction, panel processing and furniture. Leitz offers the right solution for every process.

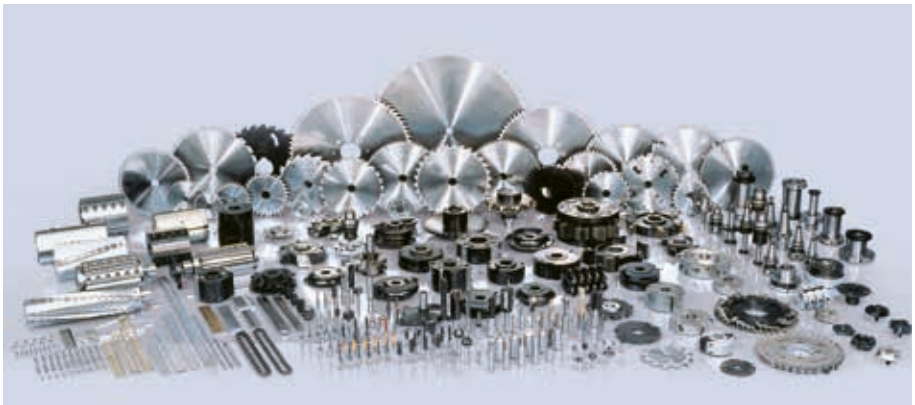

Leitz sees itself as an industrial partner and trouble shooter and offering first class consultancy services, project and process engineering, from traditional tool service to complex tool management and tool procurement, tool management, tool controlling, implementation and training. Leitz services are individually tailored and give each customer the opportunity to concentrate on his strengths and core business.

Service within hearing distance

Even the best quality tool can only give of its best if regularly maintained by experts over its entire life. Leitz offers a global tool maintenance service servicing all tools to uniform and certified quality standards – service within hearing distance. The Leitz collection and delivery service complements this professional service and ensures customers' tools are returned to them quickly.

From the edge to tool – an all in one solution

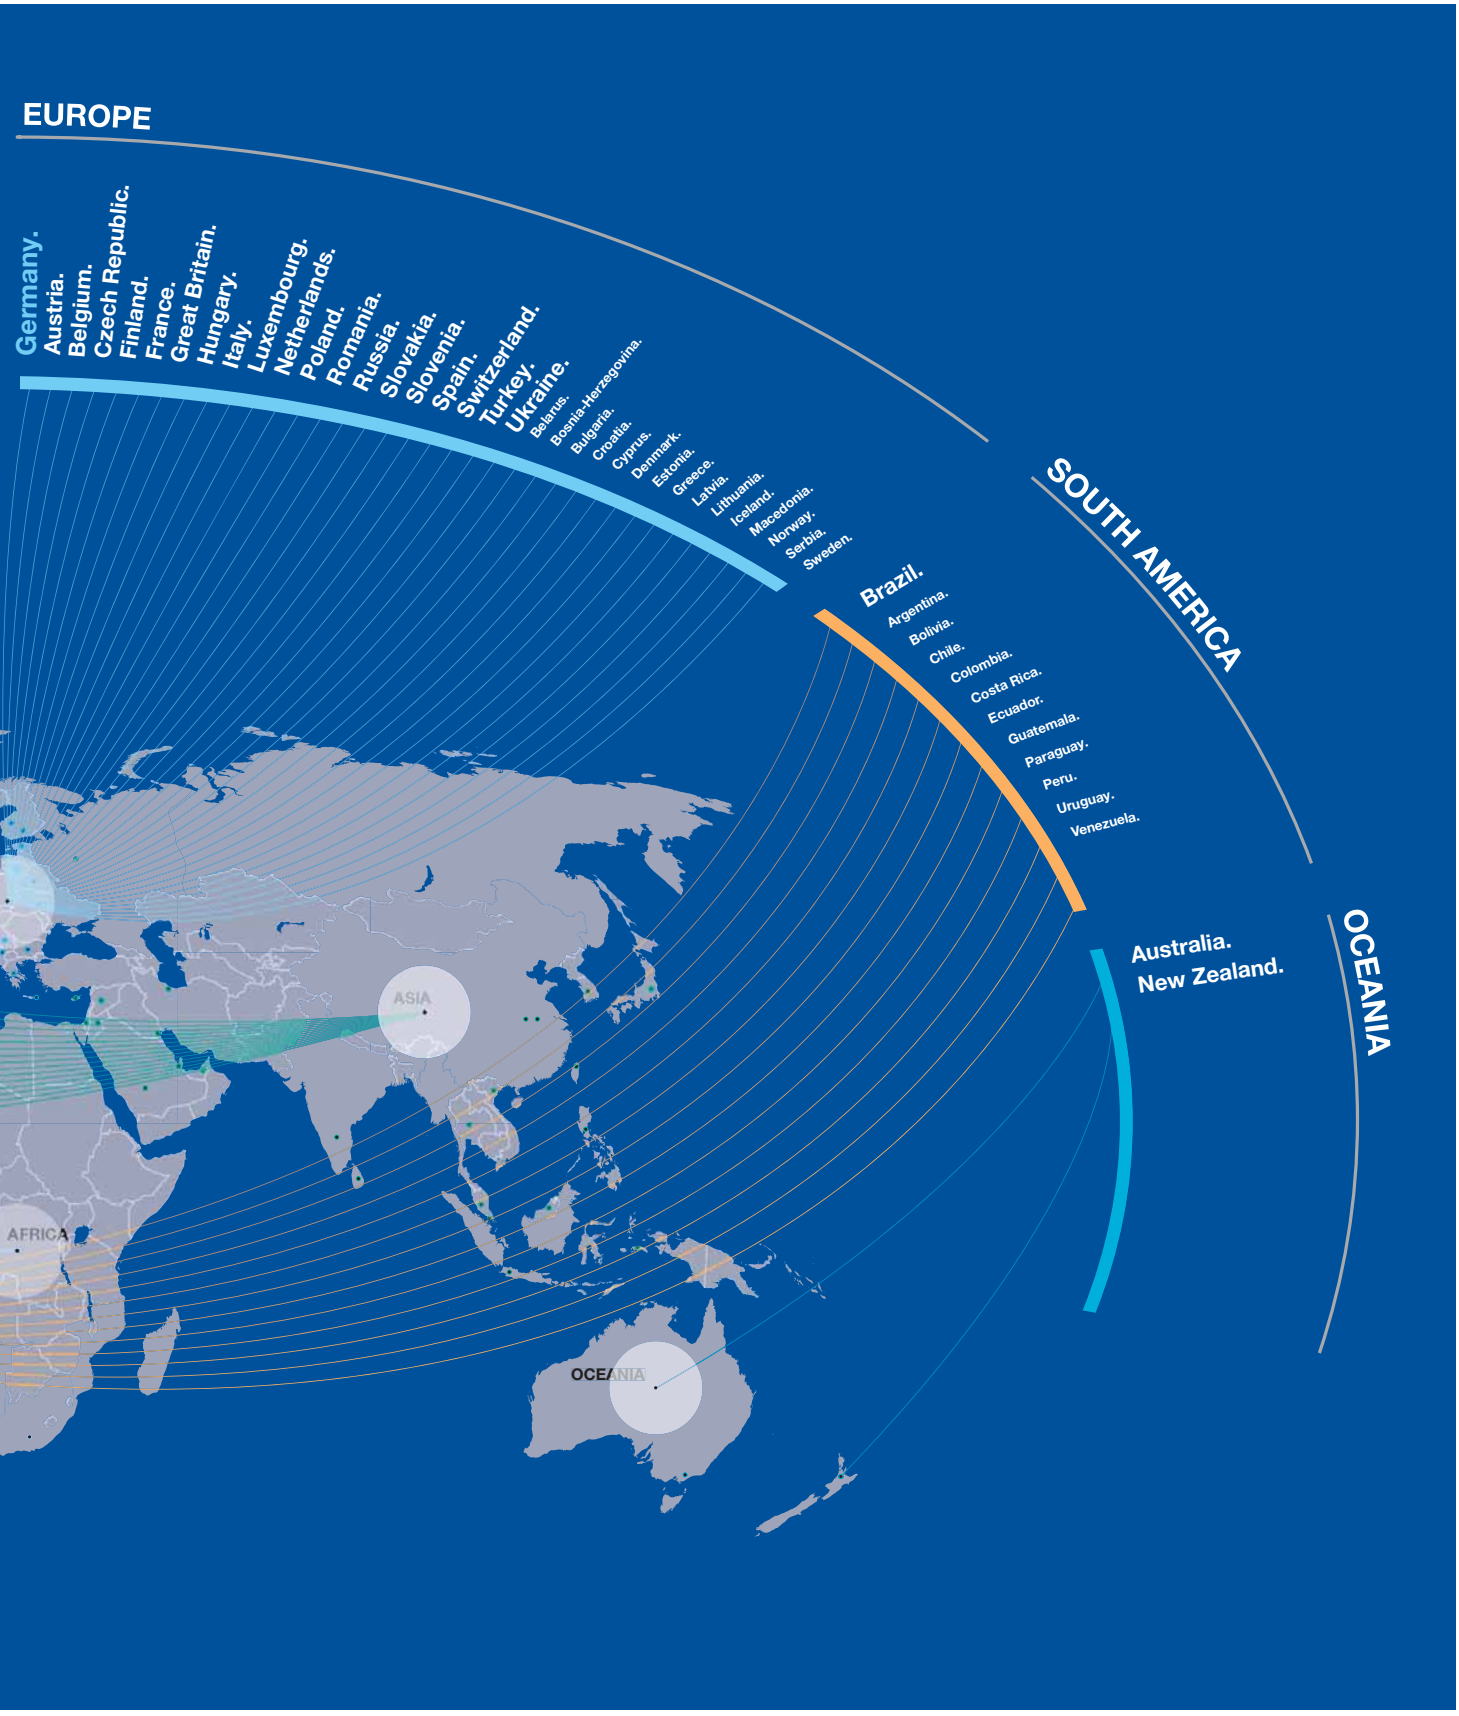

Leitz Group, Boehlerit GmbH & Co. KG of Kapfenberg, Austria and Bilz GmbH & Co. KG of Ostfildern, Germany work closely together developing and producing innovative tungsten carbide and diamond cutting materials; Here is foundation for the quality and inherent value of Leitz tools. Bilz's expertise is in tool clamping technology and is a leading manufacturer of thermal clamping systems for high speed machining of metal, wood and plastics. Bilz's products influence the economic success of Leitz tools. The knowledge and the development capability of Leitz, Boehlerit and Bilz opens up promise exciting prospects for the three companies and their customers.

Important Order and Delivery Notes

Standard tools
The identification number clearly defines the tool. All the data the identification number, dimensions, direction of rotation and cutting material add to the information and help avoid wrong deliveries in case of an inaccurate identification number. Shank tools and tools with bore are detailed below as examples.

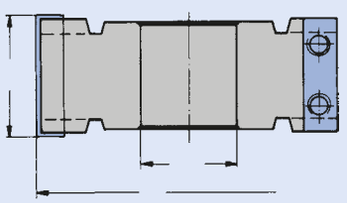

Shank tool

Identification:	Router cutter Diamaster Quattro
Item number:	WO 140 2
Ident. no.:	091147
Dimensions:	D x GL/NL x (d x l) 25 x 100/38 x (20 x 50)
Dir. of rotation:	LH (clockwise)
Cutting material:	DP (poly-crystalline diamond)

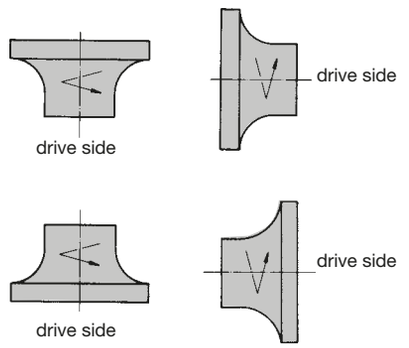

Tool with bore

Identification:	Rebating cutterhead
Item number:	WW 420 1 01
Ident. no.:	024498
Dimensions:	D x SB x BO; Z/V 125 x 50.4 x 30; Z2/V4
Cutting material:	HW (tungsten carbide)

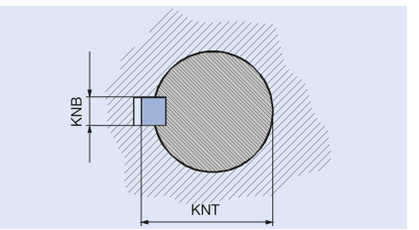

Special tools
Smooth enquiry and order processing requires detailed information. – The enquiry and order forms aid the order process and prevent errors. The following information will help you complete the order form.

Characteristic tool data
- Diameter x cutting width x bore (tools with bore)
- Diameter x working length x shank dimension (shank tools)
- Number of teeth
- Profile depth
- Direction of rotation (from the drive side)
- Speed of rotation
- Feed speed
- Keyway dimensions
- Tool design
- Quality of cutting material (HS, Stellite™, tungsten carbide, diamond)
- Type of feed: Manual feed (MAN) or Mechanical feed (MEC)

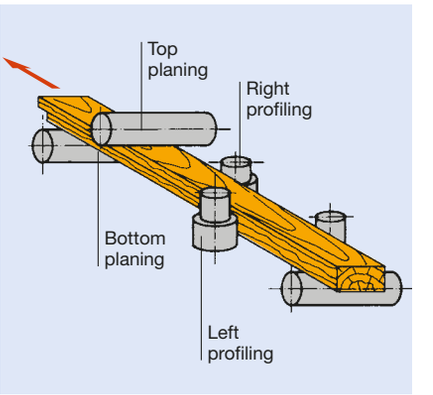

Direction of rotation right.

Keyway reference dimensions measured on the spindle

For bevelling, rebating and profiling tools we always supply:
Right hand rotation tools with the large diameter or spur to the top (unless specified differently at the time of order).

Tool set data
- Material: e. g.: softwoods, hardwoods, tempered or compressed woods, plywood boards, wood core boards, wood chipboards, MDF boards, soft fibreboards, hard fibreboards, compressed glulam, laminated woods, plastics, etc.
- Surface finish of the material: veneered, plastic coated, lacquered, etc. (in case of doubt regarding the material or its characteristics: send a sample of the material to be processed).
- Direction of processing: processing along or across the grain. Processing with or against feed.
- Machine data: manufacturer and type, range of rotation, installed power, max. tool dimensions, interfaces, type of feed, etc.
- Position of the workpiece to the tool: support of the workpiece, position of the fence and feed direction.

Position of the workpiece relative to the tool

Profile information
Profile sketches or profile drawings must clearly indicate if they refer to the material (wood) or cutter. Please specify motor side, direction of rotation, dimensions and working conditions on the material sample or drawing.

Notes to the Lexicon concerning the diagrams and tables
The statements made in the diagrams and tables relate to specific conditions, and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

General Terms and Conditions
The sale of our tools is exclusively subject to our General Terms and Conditions in their respective valid version. Any sale conditions to the contrary will not be accepted by Leitz. The current version of our General Terms and Conditions you can find on www.leitz.org/AGB.

Sawing

Leitz Lexicon Edition 7 | Version 3 | 05/2025

Explanation of abbreviations

A	=	dimension A
a_e	=	cutting thickness (radial)
a_p	=	cutting depth (axial)
ABM	=	dimension
APL	=	panel raising length
APT	=	panel raising depth
AL	=	working length
AM	=	number of knives
AS	=	anti sound (low noise design)
b	=	overhang
B	=	width
BDD	=	thickness of shoulder
BEM	=	note
BEZ	=	description
BH	=	tipping height
BO	=	bore diameter
CNC	=	Computerized Numerical Control
d	=	diameter
D	=	cutting circle diameter
D0	=	zero diameter
DA	=	outside Diameter
DB	=	diameter of shoulder
DFC	=	Dust Flow Control (optimised chip clearance)
DGL	=	number of links
DIK	=	thickness
DKN	=	double keyway
DP	=	polycrystalline diamond
DRI	=	rotation
FAB	=	width of rebate
FAT	=	depth of rebate
FAW	=	bevel angle
FLD	=	flange diameter
f_z	=	tooth feed
$f_{z\ eff}$	=	effective tooth feed
GEW	=	thread
GL	=	total length
GS	=	Plunging edge
H	=	height
HC	=	tungsten carbide, coated
HD	=	wood thickness (thickness of workpiece)
HL	=	high-alloyed tool steel
HS	=	high-speed steel (HSS)
HW	=	tungsten carbide (TCT)
ID	=	ident number
IV	=	insulation glazing
KBZ	=	abbreviation
KLH	=	clamping height
KM	=	edge breaker
KN	=	single keyway
KNL	=	combination pinhole consists of 2/7/42 2/9/46,35 2/10/60
L	=	length
l	=	clamping length
LD	=	left hand twist
LEN	=	Leitz standard profiles
LH	=	left hand rotation
M	=	metric thread
MBM	=	minimum order quantity
MC	=	multi-purpose steel, coated
MD	=	thickness of knife
min^{-1}	=	revolutions per minute (RPM)
MK	=	morse taper
m min^{-1}	=	metres per minute
m s^{-1}	=	metres per second
n	=	RPM
n_{max}.	=	maximum permissible RPM
NAL	=	position of hub
ND	=	thickness of hub
NH	=	zero height
NL	=	cutting length
NLA	=	pinhole dimensions
NT	=	grooving depth
P	=	profile
POS	=	cutter position
PT	=	profile depth
PG	=	profile group
QAL	=	cutting material quality
R	=	radius
RD	=	right hand twist
RH	=	right hand rotation
RP	=	radius of cutter
S	=	shank dimension
SB	=	cutting width
SET	=	set
SLB	=	slotting width
SLL	=	slotting length
SLT	=	slotting depth
SP	=	tool steel
ST	=	Cobalt-basis cast alloys, e.g. Stellite™
STO	=	shank tolerance
SW	=	cutting angle
TD	=	diameter of tool body
TDI	=	thickness of tool
TG	=	pitch
TK	=	reference diameter
UT	=	cutting edges with irregular pitch
V	=	number of spurs
v_c	=	cutting speed
v_f	=	feed speed
VE	=	packing unit
VSB	=	adjustment range
WSS	=	workpiece material
Z	=	number of teeth
ZA	=	number of fingers
ZF	=	tooth shape (cutting edge shape)
ZL	=	finger length

Notes to the Lexicon concerning the diagrams and tables

The statements made in the diagrams and tables relate to specific conditions and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

1. Sawing

1.1 Solid wood cutting along grain 10
1.1.1 Circular sawblades thin kerf 12
1.1.2 Circular sawblades with wiper teeth 14
1.1.3 Circular sawblades without wiper teeth 18

1.2 Solid wood cutting across grain 21
1.2.1 Circular sawblades for optimising saws 22
1.2.2 Circular sawblades WZ with neg. cutting angle 23
1.2.3 Circular sawblades for joinery machines 25

1.3 Sizing 26
1.3.1 Sizing sawblades WZ 27
1.3.2 Sizing sawblades Katana 30
1.3.3 Sizing sawblades WhisperCut 31
1.3.4 Sizing sawblades HZ/DZ 32
1.3.5 Sizing sawblades FZ/TR 34
1.3.6 Sizing sawblades FZ 35
1.3.7 Scoring sawblades for table and panel saws 38

1.4 Panel sizing 40
1.4.1 Panel sizing sawblades WZ 41
1.4.2 Panel sizing sawblades FZ/TR 42
1.4.3 Panel sizing sawblades TR/TR 44
1.4.4 Scoring sawblades for panel saws KON 48
1.4.5 Scoring sawblades - softforming / postforming 51
1.4.6 Overview scoring and main sawblades 52
1.4.7 Circular sawblades for floor production 56

1.5 Cutting non-ferrous metals and plastics 57
1.5.1 Cross and mitre cut sawblades for profiles 58
1.5.2 Circular sawblades for solid panels and blocks 64

1.6 Circular sawblades for CNC 69
1.6.1 Trimming and sizing sawblades 70
1.6.2 Grooving sawblades 73

1.7 Portable saws and table-top machines 74
1.7.1 Circular sawblades WZ 75
1.7.2 Circular sawblades FZ/TR 79
1.7.3 Circular sawblades for metals - DryCut 81
1.7.4 Circular sawblades for plastics and NF-metals 82
1.7.5 Circular sawblades for saw benches 83
1.7.6 Circular sawblades for fibre cement boards 84
1.7.7 Accessories reducing rings 85

Application

For splitting or edging timber, for cutting lamellae on horizontal and vertical spindles.

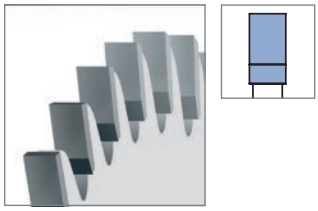

Workpiece material

Softwood and hardwood, wet, frozen, dry or long fibre materials.

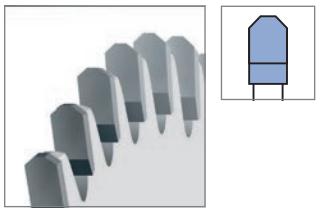

Machine

Edging, single blade, multi blade sawblades as well as sawblades with either one or two spindles. Circular saw benches or moulders.

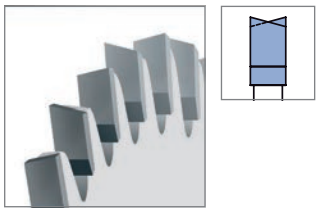

Tooth shape

FZ (square teeth):
For multi-purpose application – particularly suitable for wet and dry wood.

TR (trapezoidal teeth):
Recommended for cutting dry wood with minimum marking.

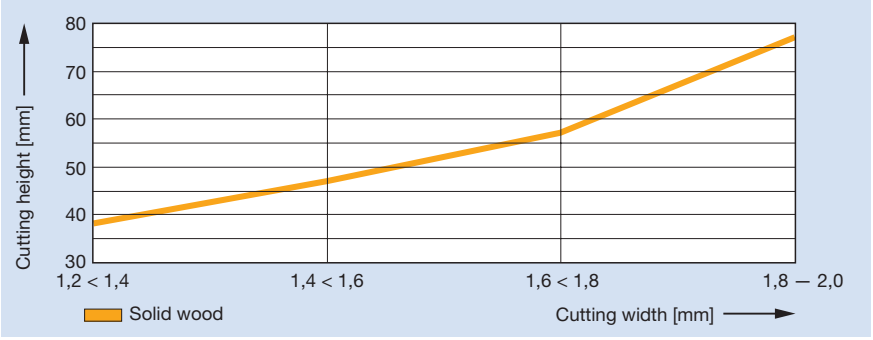

WZ (alternative top bevel teeth):
Ideal for long-fibred wood.
Higher quality on the exit surface.

Thin kerf sawblades

Application area

- Sawmill industry (laminating strips, lumber etc.).
- Solid board production (lamellos and core materials for multiple layer panels etc.).
- Parquet flooring industry (for core and surface materials, lamellos).
- Moulding products (mouldings, lippings, rulers etc.).
- Sport industry (skis, table tennis rackets etc.).

Cutting height diagram

Thin kerf circular sawblades –
Cutting height depends on the sawblade cutting width SB.

Technical notes

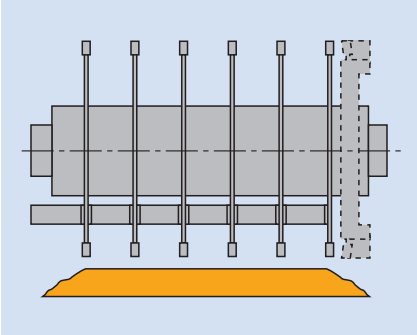

Recommendations:
- Mount thin kerf sawblades on hydro sleeves.
- Check the sawblade clamping flange diameter.
- Check the cutting height and the tooth progression (feed rate).
- Resharpen and clean resin residues regularly.

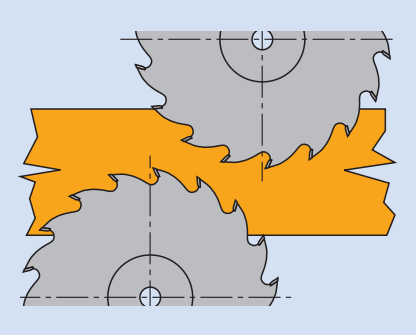

Advantages

- Environmentally friendly use of resources.
- Reduced chips and dust.
- Optimised timber usage.
- More strips from workpiece with standard cuts.

Machine types

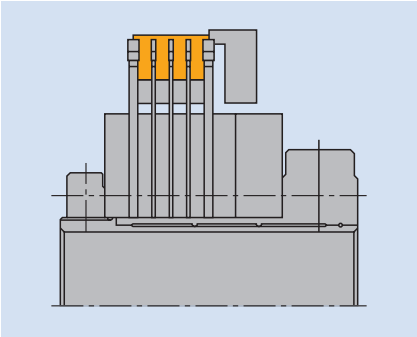

Single or multi spindle multi blade machines without automatic feed

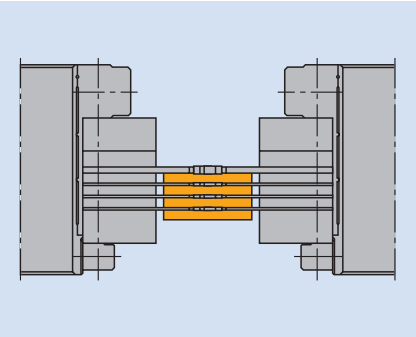

To avoid bending the sawblade, we recommend using wide sawblades or hoggers on the motorside. Riving knives are recommended when cutting thin lamella; a split machine table is necessary.

Multi spindle machines with automatic feed (for horizontal and vertical cutting)

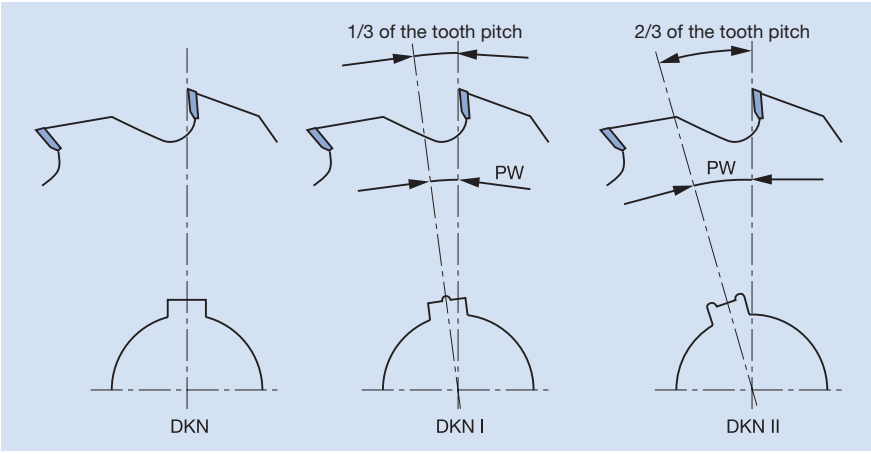

The saw spindle should have high precision bearings for accuracy.

Precise and stable feeding devices needed for bent, curved or twisted materials.
- Accurate adjustment of spindle and guide needed when sawing vertically (top and bottom side spindles).

- For horizontal cutting, the thickness of riving knives depends on the cutting width of the sawblades. The riving knives must be aligned 100% horizontal.

Position of double keyways for spiral arrangement of circular sawblades

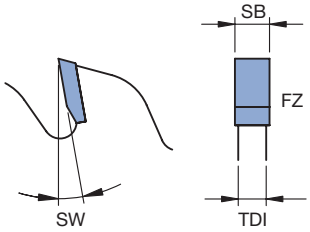

HW

Premium lamella cut - middle cut with extremely reduced cutting width

Application:
For cutting strips and slats along grain on horizontal and vertical spindles.

Machine:
Moulders with/without forced guidance of workpieces. Application on single, double, horizontal or vertical spindles.

Workpiece material:
Softwood and hardwood, dry up to 10 % wood moisture content, quality category 0 to 1.

Technical information:
Noise-reduced and low vibration design due to irregular tooth pitch or odd number of teeth. Cutting width reduction for high wood savings and efficient energy utilisation. Continuous tool body without recess for max. cutting height. Different number of teeth for optimal tooth feeds with different feed speed. Higher cutting performance and less resinification due to special coating of the tool body. Use on hydro sleeves or clamping arbors is recommended, as is the use of high precision spacers to increase the performance of the saws. It is essential to pay attention to the setting of machines with riving knives.

HW

Lamella cut - shoulder cut

Application:
For cutting along grain - shoulder cuts in combination with middle cut sawblades.

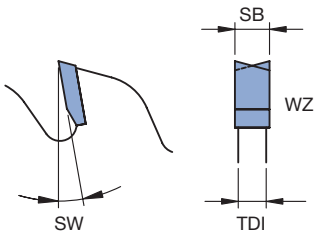

Machine:
Moulders with/without forced guidance of workpieces. Application on single, double, horizontal or vertical spindles.

Workpiece material:
Softwood and hardwood, dry up to 10 % wood moisture content, quality category 0 to 1.

Technical information:
Suitable for utilisation as a set in combination with thin kerf sawblades for middle cuts. Solid design to increase the rigidity of the set. Higher cutting performance and less resin formation by special coated toolbody.

HW

Lamella cut with internal and external wiper teeth

Application:
For cutting along grain - shoulder and trimming cuts.

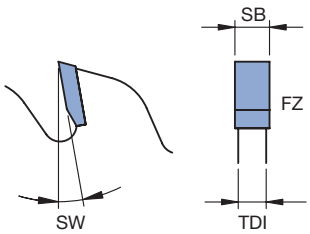

Machine:
Edging, single blade, multi blade saws as well as saws with one or two spindles.

Workpiece material:
Softwood and hardwood wet, frozen, dry. Long fibre materials (poplar, balsa etc.)

Technical information:
With two internal and external (from D 280 mm) raker blades. Solid design especially for edge cuts. Large lateral tooth protrusions. For universal use in dry, wet and frozen soft and hard woods. Higher cutting performance and less resinification due to special coating of the tool body.

Lamella cut with internal and external wiper teeth *Premium* - reduced cutting width

Application:
For cutting of thin slats on vertical spindles.

Machine:
Edging, single blade, multi blade saws as well as saws or moulders with one or two spindles.

Workpiece material:
Softwood and hardwood, dry up to 10% wood moisture content.

Technical information:
With two external and internal raker blades for increased stability also for larger cutting depths. Efficient energy and wood utilization through reduced cutting widths. Higher cutting performance and less resinification through special coating of the tool body.

Middle cut

HW

Lamella cut for glueable cuts

Application:
For cutting along grain - glueable middle and lamellae cuts on horizontal spindles.

Machine:
Single blade, multi blade saws as well as saws and moulders with one or two spindles.

Workpiece material:
Softwood and hardwood, dry up to 10% wood moisture content.

Technical information:
Special tooth geometry for gluable cutting areas. Noise-reduced design due to irregular tooth pitch. Continuous tool body without recess. Increased cutting performance and less resinification through special coating of the tool body.

Lamella cut

Application:
For cutting along grain - shoulder and trimming cuts.

Machine:
Edging, single blade, multi blade saws as well as saws with one or two spindles.

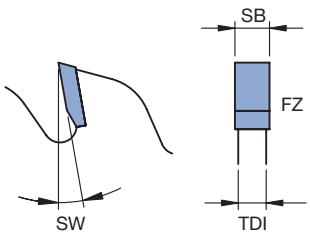

Workpiece material:
Softwood and hardwood wet and dry.

Technical information:
Large gullet area and large lateral tooth protrusion. Solid desing particularly for edge cuts. For universal use in dry and wet soft and hard woods. Design without raker blades. Partially suitable for larger cutting depths and the use in frozen woods.

Application area	For trim, cross, mitre and sizing cuts.
Workpiece material	Solid wood with or without coating, plywood, glulam, solid surface materials.
Machine	Combined table, mitre, radial, underfloor and optimising saws.

Application

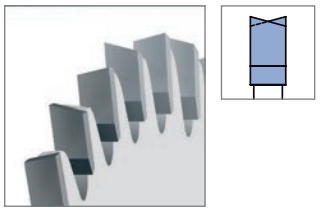

The cutting force of sawblades with a positive cutting angle and the spindle below the workpiece or for sawblades with a negative cutting angle and the spindle above the workpiece. Press the material onto the table.

On radial saws, the use of sawblades with a negative cutting angle cutting against the feed is obligatory (see EN 1870-17). The negative cutting angle presses the material onto the table.

Tooth shape

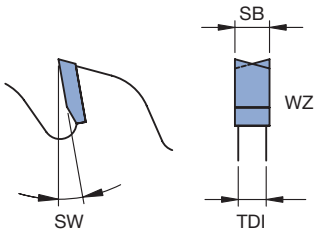

WZ (alternative top bevel teeth): Multi purpose tooth shape, economical to purchase and maintain – suitable for solid wood and wood derived materials.

HW

Trimming at high feed rates

Application:
For trimming and cross cutting with cycle times of 0.3 - 1.0 sec.

Machine:
Cross, trimming and optimising saws.

Workpiece material:
Solid wood wet and dry across grain, solid wood profiles across grain.

Technical information:
For fast cross-cutting, sizing and optimizing machines. Large lateral tooth clearance and a high number of teeth. Stable corner angle of 20° for tear-free cutting results and long tool life.

Trimming at high feed rates

Working process	For cross cutting and sizing; grooving and cutting also possible if safety regulations are followed.
Workpiece materials	Solid wood, wood derived materials, synthetic materials and light metals.
Machines	Table saws, sizing machines with/without scoring saw, vertical panel sizing saws and twin sizing saws.
Application	Suitable for cutting from below against the feed. On vertical panel sizing machines and twin saw dimension saws cutting from either below or above against the feed.

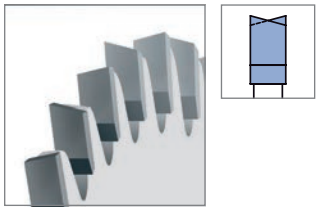

The positive cutting angle presses the material onto the table for sawblades with a positive cutting angle and the spindle below the workpiece.

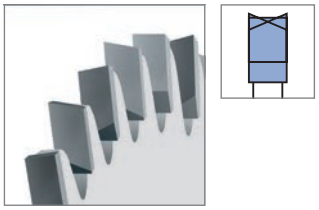

The negative cutting angle presses the material onto the table for sawblades with a negative cutting angle and the spindle above the workpiece.

On radial saw machines, sawblades must be used (see EN1870-17) with a negative cutting angle against the feed.

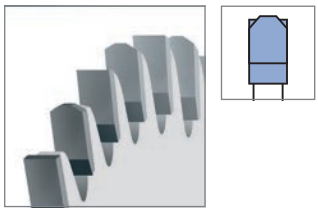

Tooth shape

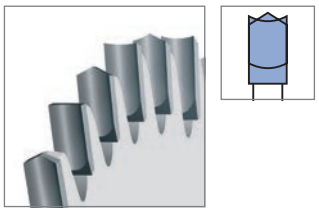

WZ (alternative top bevel teeth): Multi-purpose tooth shape, economical to purchase and maintain. Ideal for chipboard, veneered chipboard, solid wood, block board, plywood.

WZ/WZ/FZ (alternative/square teeth): Tooth shape for solid wood, glulam and coated or veneered wood derived materials; tear-free cutting edges and high cut quality. Combinations of tooth forms (WZre, WZli, WZre, WZli, FZ).

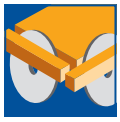

FZ/TR (square/trapezoidal teeth): Tooth shape for plastic and foil coated wood derived materials.
TR/TR (trapezoidal/trapezoidal teeth): Best tooth shape for cutting hard and abrasive coatings – can be altered from the existing FZ/TR shape.

HZ/DZ (hollow face/inverted V teeth): Tooth shape for high cutting quality on plastic coated materials, with high upper and lower edge quality on machines without a scoring saw.

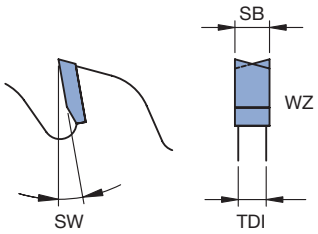

HW

Low Noise

Sizing *Premium*

Application:
For sizing and cross cutting with/without scoring.

Machine:
Table and sizing saws.

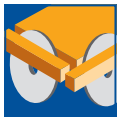

Workpiece material:
Solid wood across grain, chipboard and fibre materials, laminated veneer lumber (e.g. plywood, multiplex plywood).

Technical information:
Premium design with vibration-damping laser ornaments (from D 200 mm). Marked dimensions with irregular tooth pitch (UT) for noise reduction and improved running behaviour.

HW

Low Noise

Sizing without scoring *Premium* - Mamba

Application:
For sizing and cross cutting without scoring.

Machine:
Table and sizing saws. Vertical panel sizing saws without scoring unit.

Workpiece material:
Chipboard and fibre materials paper and plastic coated, veneered, laminated veneer lumber (e.g. plywood, multiplex plywood), thin walled plastic profiles (thickness < 2 mm), thin walled plastic honeycomb boards.

Technical information:
Special WZ with 40° corner angle for tear-free cuts on both sides. **Premium** design with vibration damping laser ornaments. Particularly for machines with positioning of the saw shaft above the workpiece. Negative cutting angle for improved workpiece clamping.

Circular sawblade Mamba, negative cutting angle

HW

Sizing and veneer stack cut - reduced cutting width

Application:
For sizing and cross cutting with and without scoring.

Machine:
Table, sizing and veneer cutting saws.

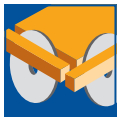

Workpiece material:
Solid wood across grain, chipboard and fibre materials, laminated veneer lumber (e.g. plywood, multiplex plywood), veneered board stacks, plastic or derived material honeycomb boards.

Technical information:
Reduced cutting width for better material utilization and lower cutting forces. Marked ID numbers with recessed tool body and thus limited cutting depth.

Sizing cut *Excellent* - Katana

Application:
For sizing and cross cutting without scoring.

Machine:
Table and sizing saws, vertical panel sizing machines without scoring unit, cross, trimming and
mitre cutting saws.

Workpiece material:
Solid wood across grain, laminated veneer lumber (e.g. plywood, multiplex plywood), honeycomb boards, thin walled plastic and non-ferrous metal profiles.

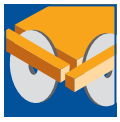

Technical information:
Katana tooth combination with alternating rake face bevel for highest cutting quality. High number of teeth for perfect edges and very smooth surfaces. **Excellent** design with plastic filled laser ornaments for vibration damping and reduction of noise level.

Working process	For sizing single boards or boards in stacks.
Workpiece materials	Solid wood, wood derived materials and plastic.
Machines	Table saws and panel sizing saws with pressure clamping beam.
Type of application	Scoring sawblades cut with the feed main sawblades cut against the feed.

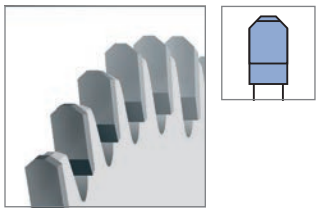

Tooth shape

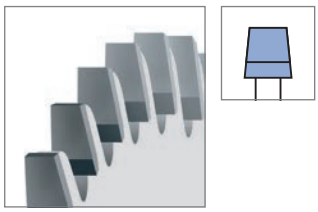

WZ (alternative top bevel teeth): Multi-purpose tooth shape, economical to purchase and maintain. Ideal for chip-board, veneered chipboard, solid wood, block board, plywood and similar materials.

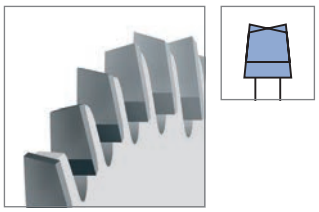

FZ/TR (square/trapezoidal teeth): Tooth shape for plastic coated and foil coated wood derived materials.

TR/TR (trapezoidal/trapezoidal teeth): Tooth shape for especially abrasive materials such as HPL or CPL coated wood derived materials.

KON/FZ (flat teeth – conical): For scoring sawblades. Prevents splitting of the cut edge by the main sawblade as it passes through the bottom surface of the panel.

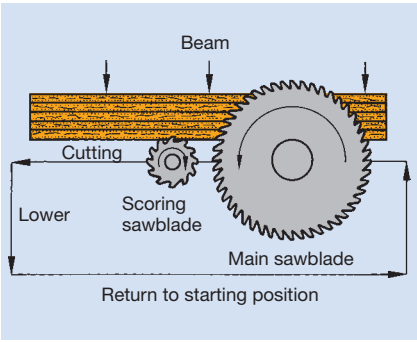

KON/WZ (alternative top bevel teeth – conical): For scoring sawblades. Prevents splitting of the cut edge by the main sawblade as it passes through the bottom surface of the panel with low cutting pressure.

Scoring sawblades

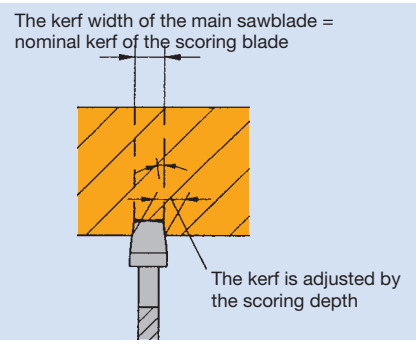

A scoring saw is recommended for a high cut edge quality on both sides of coated panels. The scoring sawblade cutting width (kerf) is slightly larger than the width (kerf) of the main sawblade so the exiting tooth of the main sawblade does not touch the bottom surface cut edge.

As precise, flat workpiece positioning is only possible with pressure clamping, split scoring sawblades are used on table and panel saw.

Schematic representation

Panel sizing machine with scoring saw and top pressure beam.

Setting of conical scoring sawblade. The cutting width (kerf) has to be matched to the cutting width (kerf) of the main saw during maintenance of the tools.

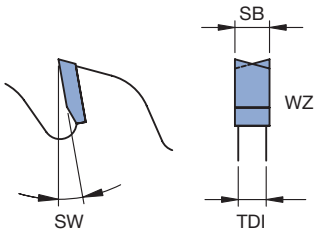

HW

Sizing of single boards and stacks of boards *Premium*

Application:
For panel sizing of single boards and stacks of boards with scoring.

Machine:
Panel sizing saws with scoring unit and pressure beam.

Workpiece material:
Chipboard and fibre materials paper and plastic coated, veneered.

Technical information:
Premium design with vibration damping laser ornaments.

HW

Low Noise

Sizing of single boards in finish cut quality - RazorCut

Application:
For panel sizing of single boards and stacks of boards with low cutting heights (up to 60 mm) with scoring.

Machine:
Panel sizing saws with scoring unit and pressure beam.

Workpiece material:
Chipboard and fibre materials plastic coated, duroplastics (compact laminate panels, e.g. HPL).

Technical information:
Special cutting geometry for excellent cutting results in finish cut quality. Suitable for high feed speeds in batch size 1 production. Design with irregular pitch and vibration damping laser ornaments for optimal running behaviour.

DP

Sizing of single boards and stacks of boards *Excellent*

Application:
For panel sizing of single boards and stacks of boards with scoring.

Machine:
Panel sizing saws with scoring unit and pressure beam.

Workpiece material:
Chipboard and fibre materials plastic coated, duroplastics (compact laminate panels, e.g. HPL), fibre reinforced materials (e.g. GFRP, CFRP).

Technical information:
DP equipment for long tool life. **Excellent** version with irregular tooth pitch and filled laser ornaments for vibration damping and reduction of noise level. Coating of the tool body for higher running performance. Mounting height 6 mm for multiple resharpening.

Panel sizing sawblade TR/TR, Diamaster PLUS

Scoring sawblade KON/WZ

Application:
For scoring with feed.

Machine:
Panel sizing saws with scoring unit and pressure beam.

Workpiece material:
Chipboard and fibre materials paper and plastic coated, veneered, laminated veneer lumber (e.g. plywood, multiplex plywood).

Technical information:
Scoring depth 1.50 - 2.00 mm. For universal use in any surface coating. The suitable scoring circular sawblade must be selected depending on the cutting width of the main saw.

Scoring sawblades KON/FZ

Application:
For scoring with feed.

Machine:
Panel sizing saws with scoring unit and pressure beam.

Workpiece material:
Chipboard and fibre materials paper and plastic coated, veneered, laminated veneer lumber (e.g. plywood, multiplex plywood).

Technical information:
Scoring depth 1.50 - 2.00 mm. Recommended especially for use in plastic and HPL-coated panels. The suitable circular scoring sawblade must be selected depending on the cutting width of the main saw.

Scoring sawblades KON/FZ *Excellent*

Application:
For scoring with feed.

Machine:
Panel sizing saws with scoring unit and pressure beam.

Workpiece material:
Chipboard and fibre materials paper and plastic coated, veneered, laminated veneer lumber (e.g. plywood, multiplex plywood), alu composite panels (e.g. Alucobond®), duroplastics (compact laminate panels, e.g. HPL), fibre reinforced materials (e.g. GFRP, CFRP)

Technical information:
Scoring depth 2.00 - 2.50 mm. Recommended especially for use in plastic and HPL-coated panels. Long tool life due to DP tipping. The suitable circular scoring sawblade must be selected depending on the cutting width of the main saw. Can be used in combination with HW- and DP-tipped main circular sawblades. The cutting width (SB) of the scoring circular sawblades is 0.1 mm less for use in combination with resharpened TC-tipped main circular sawblades.

HW

Scoring sawblade - softforming / postforming

Application:
For scoring with feed at high feed rates and deep cutting depths.

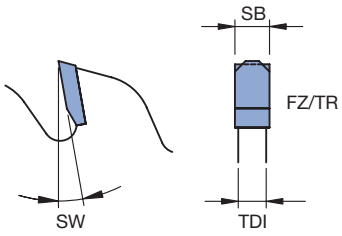

Machine:
Panel sizing saws with adjustable soft and postforming units and pressure beam.

Workpiece material:
Chipboard and fibre materials paper and plastic coated.

Technical information:
Dimension and tooth shape according to machine manufacturers‘ specification.

Middle cuts

Application:
For cutting of panels along grain for floor production.

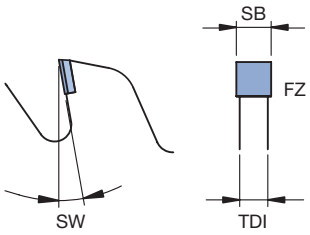

Machine:
Multi blade saws.

Workpiece material:
Chipboard and fibre materials paper and plastic coated, veneered.

Technical information:
DP tipping for long tool life. Circular sawblades BO = 115 mm for Hydro-Duo sleeve ID **030555** or BO = 110 mm for clamping flange TR 810 0. Tip height 5.5 mm. Tool body coated for higher running performance.

Working process	For splitting, mitre cutting and sizing. Spray lubrication recommended when machining non-ferrous metal profiles.
Workpiece materials	Non-ferrous and plastic profiles, composites, insulating material and aluminium compound materials.
Machines	Splitting, trimming, mitre joint, double cross cutting and sizing machines.
Application	 Positive cutting angle: The positive cutting angle presses the workpiece onto the table. For circular sawblades with the tooth shape FZ/TR and the spindle below the workpiece for cross and mitre cutting with material thickness > 2.5 mm.  Negative cutting angle: The negative cutting angle presses the workpiece onto the table. For circular sawblades with the tooth shape FZ/TR and the spindle above the workpieces for cross and mitre cutting with material thickness < 2.5 mm.
Tooth shape	 FZ/TR (square/trapezoidal teeth): Tooth shape for non-ferrous metals and plastic profiles and boards.  TR/TR (trapezoidal/trapezoidal teeth): Tooth shape for better cutting quality with non-ferrous and plastic profiles. If altered from the standard FZ/TR shape.

HW

Cross and mitre cuts

Application:
For trimming and mitre cuts - positioning of sawblade under the workpiece.

Machine:
Cross, trimming, mitre and radial saws as well as double mitre cutting saws and CNC machining centres.

Workpiece material:
Non-ferrous metal or plastic profiles.

Technical information:
Spray lubrication recommended when processing non-ferrous metal profiles.

HW

Low Noise

Cross and mitre cuts *Excellent*

Application:
For trimming and mitre cuts - positioning of sawblade under the workpiece.

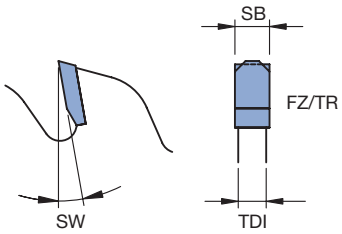

Machine:
Cross, trimming, mitre and radial saws as well as double mitre cutting saws and CNC machining centres.

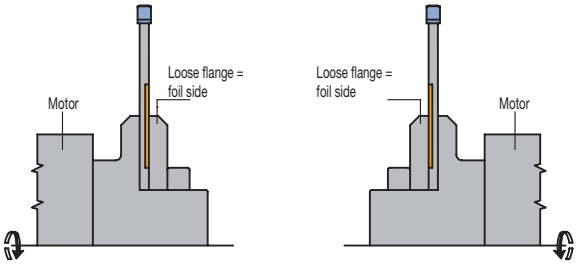

Workpiece material:
Non-ferrous metal or plastic profiles.

Technical information:
Spray lubrication is recommended when machining non-ferrous metal profiles. **Excellent** version. Vibration damping composite construction of the tool body by steel foil. Extreme noise reduction even with increasing dulling of the tool.

HW

Crossing and mitre cuts with negative cutting angle

Application:
For trimming and mitre cuts - positioning of workpiece under the sawblade.

Machine:
Cross, trimming, mitre and radial saws as well as double mitre cutting saws and CNC machining centres.

Workpiece material:
Non-ferrous metal or plastic profiles.

Technical information:
Spray lubrication is recommended when machining non-ferrous metal profiles. Because of the negative cutting angle, it is particularly suitable for profiles where hooking and deformation of the profiles should be avoided. Particularly suitable for cutting from above. Negative cutting angle for improved workpiece clamping.

HW

Low Noise

Crossing and mitre cuts with negative cutting angle
Excellent

Application:
For trimming and mitre cuts - positioning of workpiece under the sawblade.

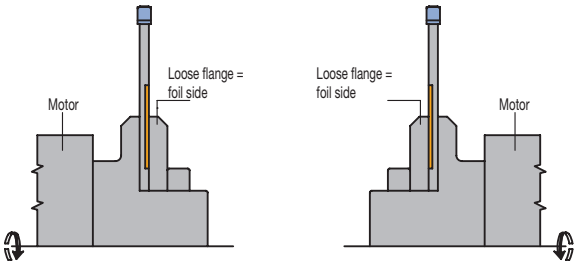

Machine:
Cross, trimming, mitre and radial saws as well as double mitre cutting saws and CNC machining centres.

Workpiece material:
Non-ferrous metal or plastic profiles.

Technical information:
Spray lubrication is recommended when machining profiles made of non-ferrous metal. Negative cutting angle makes it particularly suitable for profiles where hooking and deformation of the profiles are to be avoided. Particularly suitable for cutting from above. Negative rake angle for improved workpiece clamping. **Excellent** version. Vibration damping composite construction of the support body by steel foil. Extreme noise reduction even with increasing dulling of the tool.

HW

Cross and mitre cuts with reduced cutting width

Premium

Application:
For trimming and sizing.

Machine:
Cross, trimming, mitre and portable saws.

Workpiece material:
Thin walled, non-ferrous metal or plastic profiles, plastic honeycomb boards, fibre reinforced plastics (e.g. GFRP, CFRP), plastic wave boards (e.g. PVC).

Technical information:
Due to reduced cutting width and high number of teeth, especially suitable for thin-walled profiles (wall thickness < 2 mm) and thin panels. Negative cutting angle for smoother running. Special coating of the tool body for less adhesions.

HW

Sizing in easy melting plastics

Application:
For sizing and cross cutting without scoring.

Machine:
Table and sizing saws, vertical panel sizing saws, panel sizing saws with pressure beam.

Workpiece material:
Easy melting plastics (e.g. PP, PA).

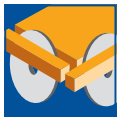

Technical information:
Reduced number of teeth for lower heat generation as well as lower feed forces and lower power consumption even at large cutting depths. Tooth shape for cutting pitch and reduction of heat generation. Large chip spaces for optimum chip transport. Circular saw blade with suitable number of teeth must be selected depending on the material thickness. Low number of teeth for large workpiece thicknesses.

HW

Low Noise

Type 1:
Countersink right
Type 2:
Countersink left
Type 3:
Pinhole without countersink

Trimming and sizing on CNC machining centres
Excellent - Katana

Application:
For sizing of panels on CNC machining centres.

Machine:
Processing units on CNC machining centres.

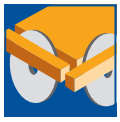

Workpiece material:
Chipboard and fibre materials paper and plastic coated, veneered, laminated veneer lumber (e.g. plywood, multiplex plywood), solid wood panels across grain and for mitre joints.

Technical information:
Katana tooth combination with alternating rake face bevel for highest cutting quality. High number of teeth for perfect edges and very smooth surfaces. Very well suited for mitre cuts in coated wood materials. Recommendation for use: When sizing coated wood-derived materials, for best cutting quality, first scribe with a small infeed (1 - 2 mm) in the same direction and then cut in the opposite direction. Suitable for mounting on saw flanges of machining units. Balancing quality adapted for use on CNC aggregates. **Excellent** design with filled laser ornaments for vibration damping and reduction of noise level.

Trimming and sizing on CNC machining centres
Excellent - WhisperCut

Application:
For sizing of panels on CNC machining centres.

Machine:
Processing units on CNC machining centres.

Workpiece material:
Chipboard and fibre materials paper and plastic coated, veneered, laminated veneer lumber (e.g. plywood, multiplex plywood), solid wood panels across grain and for mitre joints.

Technical information:
Extreme noise reduction. Specially developed group serration for perfect cutting pitch and reduction of cutting forces. High tool life due to stable tooth geometry and DP tipping. Universally applicable for a wide range of materials. Recommendation for use: For optimal cutting quality when sizing coated wood-based materials, first make a scribing cut with the feed (1-2 mm deep), then perform the main cut against the feed on the return stroke. Suitable for mounting on saw flanges of machining units. Balancing quality adapted for use on CNC units. Can be resharpened 2 times. **Excellent** design with filled laser ornaments for vibration damping and reduction of noise level.

Type 2: Countersink left
Type 3: Pinhole without countersink

DP

Grooving on CNC machining centres

Application:
For grooving.

Machine:
Processing units on CNC machining centres.

Workpiece material:
Chipboard and fibre materials paper and plastic coated, veneered, laminated veneer lumber (e.g. plywood, multiplex plywood).

Technical information:
Due to special tooth combination and high number of teeth suitable for tear-free grooves in any coatings. Mounting on saw flange of machining units. Use with feed recommended for best machining quality.

Working process	For sizing, trimming and splitting.
Workpiece materials	Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), without coat-ing, with plastic coating, with veneer, glulam, plywood, duroplastics, thermo-plastics, solid surface materials (Corian, Varicor etc.), compound materials (HPL, Tres-pa etc.), non-ferrous metals (aluminium, copper etc.).
Machines	Portable saws, trimming, mitre-joint machines, table saws and radial arm cross cut, light sizing saws.
Types of application	For cutting along and across grain, trimming and mitre cut.

Tooth shapes

WZ (alternative top bevel teeth)

FZ/TR (square/trapezoidal teeth)

Teeth shape	Machine	Area of application
Square teeth	Portable saws	Solid wood along and across the grain, glued materials.
Alternative top bevel teeth – positive	Pull push saw, table and radial arm cross cut saws, light sizing saws.	Uncoated, plastic coated, veneered wood derived materials. Plywood, multiplex plywood. Composite/laminated materials.
Alternative top bevel teeth – negative	Trimming-, pull push saw, table saws and radial arm cross cut saws.	Solid wood across grain. Plastic hollow wall profiles. Non-ferrous metals – extruded profiles and pipes.
Flat/trapezoidal teeth – positive	Portable saws, pull push saw, table saws and radial arm cross cut saws, light sizing saws.	Uncoated wood derived materials, plastic coated, veneered. Non-ferrous metals – extruded profiles and pipes. NE-metals. Al-PU sandwich panels. Plastic hollow wall profiles. Plastic polymers (Corian, Varicor etc.).
Flat/trapezoidal teeth – negative	Portable saws, trimming-, mitre saws, table saws and radial arm cross cut saws.	Non-ferrous metals – extruded profiles/pipes. Plastic hollow wall profiles. Al-PU sandwich panels.
Alternative flat tooth with bevel	Portable saws, trimming-, mitre saws, table saws and radial arm cross cut saws, light sizing saws.	Flat and angle steel, steel plates, pipes, profiles, sandwich panels, composite materials.

Tooth pitch/cut quality

The saw cut quality is determined by the correct choice of the tooth shape and by the distance between the teeth. The distance between the teeth is determined by the tooth pitch.

Number of teeth	Tooth pitch	Cut quality
Low	~ 25 – 50 mm	For coarse cuts.
Medium	~ 14 – 25 mm	For good cutting quality.
High	~ 9 – 14 mm	For clean cuts to a very high quality.

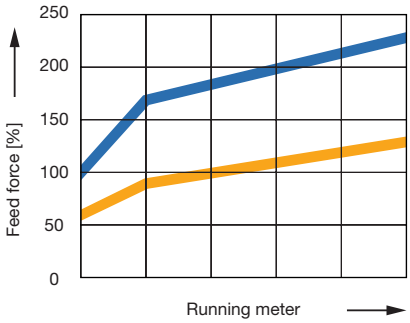

HW

Comparison of feed force (MDF 38 mm)

Conventional circular sawblade, Z 48, SB 2.2 mm, WZ

Leitz AccuCut circular sawblade, Z 42, SB 1.8 mm, WZ/WZ/WZ/FZ

Universal sizing - AccuCut

Application:
For cross-cut and sizing.

Machine:
Accu-portable sawblades.

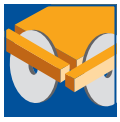

Workpiece material:
Solid wood lengthwise and crosswise as well as glued, chipboard and fibre materials raw, plastic- and paper-coated, veneered, laminated wood (e.g. plywood, multiplex).

Technical information:
Long battery life due to thin kerf, cutting force-reduced cutting geometry and innovative tooth pitch. Very good cutting quality due to high number of teeth.

HW

Circular sawblades for cutting logs

Application:
For sizing across grain, trimming and cross cutting.

Machine:
Rolling table saws and log saws.

Workpiece material:
Softwood and hardwood wet and dry.

Technical information:
Design with chip thickness limitation. Narrow cutting width and reduced number of teeth for reduced power consumption even with thick logs.

Circular sawblades WZ with thickness limitation

HW

Low Noise

Universal sizing

Application:
For universal use on building sites.

Machine:
Universal cutting saws.

Workpiece material:
Panels and timbers with small concrete and metal inclusions, wood wool (e.g. Heraklith), gypsum plasterboard and form work panel of veneer, gas aerated slabs, Styrodur slabs, roundwood and squared timbers.

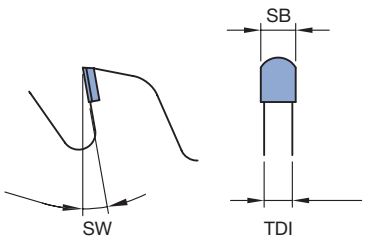

Technical information:
Tool body with round closed form and stable tooth shape. Special tungsten carbide grade for all requirements on construction sites. Noise reducing design.

	Possible cause	Action
Sawblade wobbles	– Thickness of tool is too low.	Select a sawblade with a larger kerf or a smaller diameter or increase flange diameter.
	– Insufficient tooth projection over tool body (sawblade jams in the cut, runs hot, tension lost).	Select a sawblade with a higher lateral tooth projection.
	– Resin/chips on the flanges.	Clean flanges.
	– Flange run out tolerance too high.	Check and correct flange.
	– Defective motor spindle bearing.	Replace motor spindle bearing.
	– Tooth pitch and gullet too small.	Select a sawblade with a higher tooth pitch.
	– Unbalanced sawblade.	Balance the sawblade.
	– Blunt cutting edges.	Resharpen the sawblade.
	– Wrong sawblade tensioning.	Correct sawblade tensioning.
Wavy cut	– Irregular tooth pitch or one sided cut.	Correct sharpening machine adjustment, resharpen the sawblade.
	– Irregular tooth thickness.	Check and correct sawblade kerf.
	– Sawblade is blunt resin build up.	Clean and resharpen the sawblade.
	– Position of fence not parallel to feed direction.	Check and adjust position.
	– One sided load from edge cutting.	Use edging sawblades (hogger).
	– Cutting speed too low.	Select a larger sawblade diameter or increase RPM.
	– Wrong sawblade tensioning.	Correct sawblade tensioning.
Jamming of sawblade in cut	– Slot in saw bed is too big, insufficient chip flow, causing jamming between the saw and slot.	Replace saw bed.
	– Riving knife width is too thin.	Replace riving knife.
	– Gullet too small.	Select sawblade with larger gullet.
Curved cut when double edging	– Sawblades sharpened one sided.	Resharpen sawblade (correct kerf of sawblade and sharpening machine adjustment).
	– Resin and glue on rollers.	Clean and, if necessary, resharpen rollers.
	– Differences in wood thickness.	Improvements necessary at customer.
	– Too high cutting forces on one side.	Optimise cutting force division.
	– Worn conveyor belt guide.	Check and adjust chain guide.
	– Short and uneven workpieces.	Comply with minimum workpiece length required by the machine manufacturer‘s instructions.
	– When machining short workpieces and when transporting piece by piece.	Pay attention to angular cut off work pieces.

Problem	Possible cause	Action
Exceeded tolerances of horizontally cut lamellas	– Sawblade tensioning not suitable for horizontal application.	Check the sawblade tensioning.
	– High resin build up on tool, tool runs very hot from friction in cut.	Clean sawblades and check if blunt.
	– Thickness and position of riving knife not adjusted to the dimensions of strips and the sawblade kerf.	Use riving knife dimension matching the sawblade kerf. Adjust riving knife spacing to correspond to the thickness of strips.
Tear outs in workpieces coated on both sides when machining without scoring saw	– Sawblade projection over workpiece too small or too big.	Check and adjust sawblade projection.
	– Tooth shape or number of teeth not suitable for the application.	Select a sawblade suitable for the application.
	– Concentric running tolerances of the sawblade too high.	Have the sawblade checked by Leitz service.
	– The flange used on the machine does not correspond to the guidelines for flange diameter and concentric running tolerances.	Check flanges and, if necessary, clean them. If there is a wrong ratio of sawblade diameter to flange diameter, adjust accordingly.
Tear outs on the panel coating when cutting in stacks	– Tool is blunt.	Resharpen main sawblade.
	– Pressure beam cannot press evenly on uneven workpieces.	Check pressing force of pressure beam.
Tear outs where the tool leaves the workpiece when cutting in stacks	– The kerf of the scoring sawblade is too small for the main sawblade in use.	Adjust kerf of scoring sawblade to main sawblade accordingly.

Rounding of cutting edge
Mechanical and chemical wear cause rounding of main and minor cutting edges of a saw tooth.

In wet solid wood (e.g. green wood) chemical wear is approximately the same as mechanical wear.

When using tungsten carbide grades with special binding agents, chemical wear can be reduced. In the woodworking sector, dry wood is machined and mechanical wear dominates.

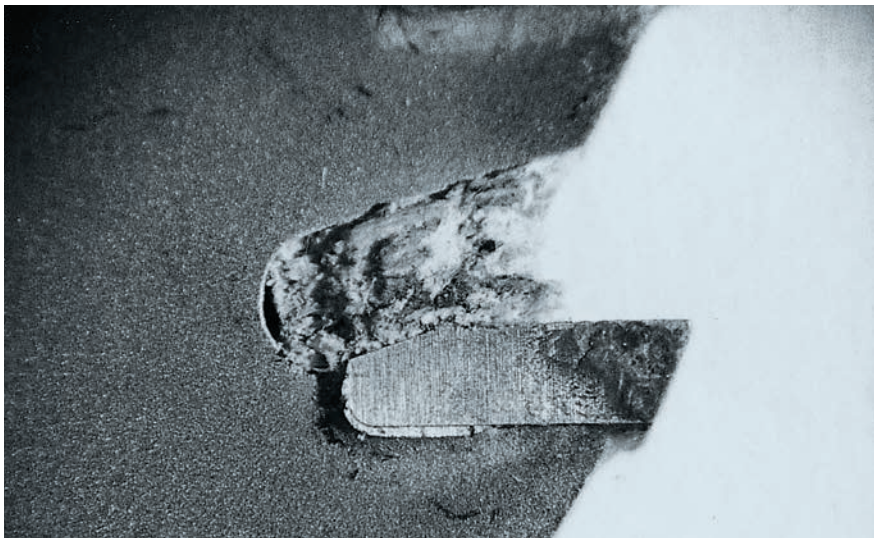

Worn HW saw tooth.

Cutting edge chips and cutting edge fracture
Hard foreign objects in the workpiece cause cutting edge chips and a deterioration of cut quality as well as increased shear forces. Mineral particles in wood derived materials are often the reason for cutting edge chips.

Saw teeth and pieces of the saw body can break off when, due to blunt cutting edges, the feed rate and cutting forces increase considerably.

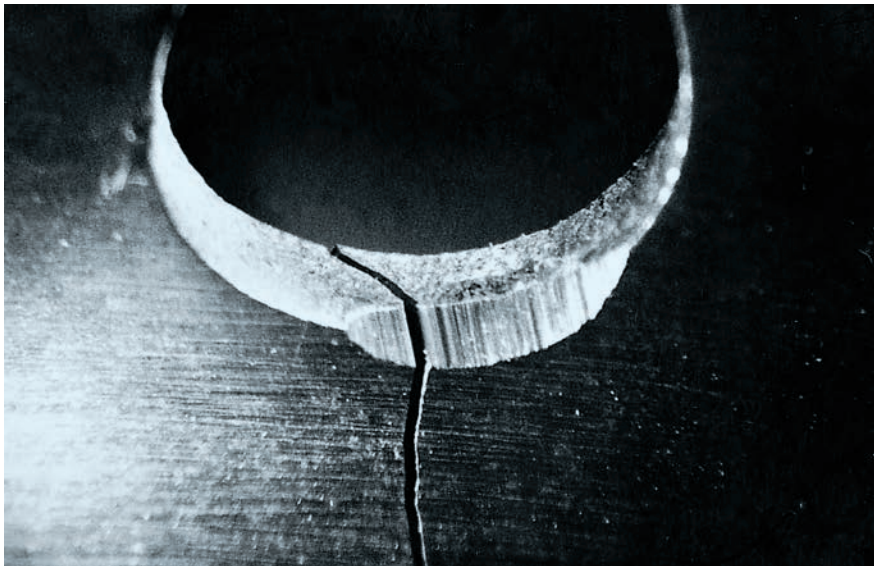

A too high tooth feed can lead to choking of the lower part of the sawblade gullet and the tooth breaking off the saw body.

Choked gullet.

Cracking of tool body
Vibrations are caused by high loads on the cutting edges and the tool body (e.g. increased bluntness, high tooth feed or one sided stress). This can cause vibration cracks in the gullet or wiper slots.

High one sided stress, e.g. when edge cutting, leads to bending, chipping or cracking of the tool body.

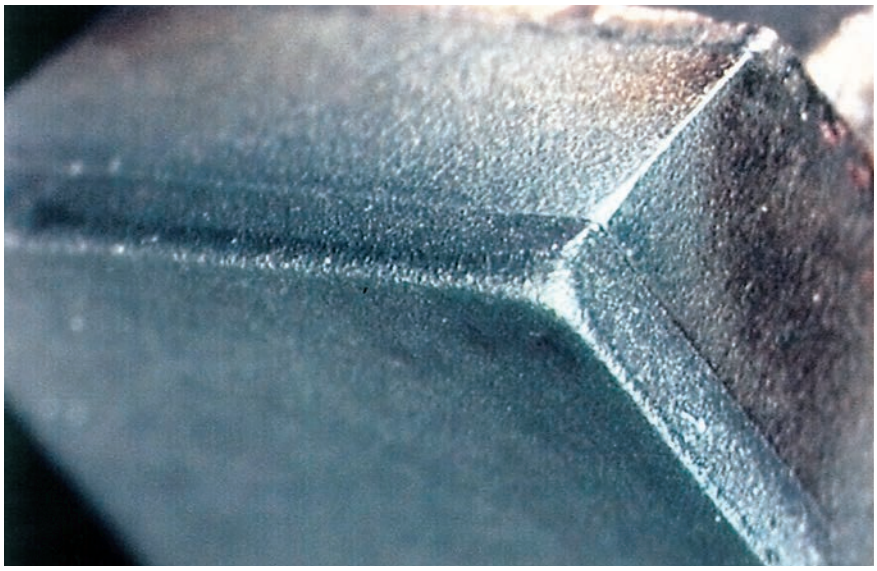

Fracture in the saw body.

Cutting edge rounding of DP
Mechanical wear of uniform workpiece materials causes rounding of the main and minor cutting edges. Apart from rounding, slight chips caused by foreign objects can occur when machining certain wood derived materials.

Rounding of the minor cutting edges can lead to reduced performance time and to deterioration in the cut and edge quality.

Action:
– Additional lateral eroding to the tooth relief angle.
This leads to:
– lower lateral tooth projection.
– loss of cutting width.
– higher resharpening costs.

Worn DP saw tooth.

Cutting edge chips and cutting edge fracture
Hard mineral or metallic objects lead to cutting edge chips and to a deterioration in the cut quality.

Cutting edge chips can also be caused by inefficient dust extraction (chip flow).

Extreme bluntness and chips lead to high cutting forces and consequently cracks in the saw body material.

The condition of cutting edges and saw bodies must be checked regularly. When the performance time is up, the tools must be resharpened by experts.

Cutting edge fracture of a DP saw tooth.

Explanation of abbreviations

A	=	dimension A
a_e	=	cutting thickness (radial)
a_p	=	cutting depth (axial)
ABM	=	dimension
APL	=	panel raising length
APT	=	panel raising depth
AL	=	working length
AM	=	number of knives
AS	=	anti sound (low noise design)
b	=	overhang
B	=	width
BDD	=	thickness of shoulder
BEM	=	note
BEZ	=	description
BH	=	tipping height
BO	=	bore diameter
CNC	=	Computerized Numerical Control
d	=	diameter
D	=	cutting circle diameter
D0	=	zero diameter
DA	=	outside Diameter
DB	=	diameter of shoulder
DFC	=	Dust Flow Control (optimised chip clearance)
DGL	=	number of links
DIK	=	thickness
DKN	=	double keyway
DP	=	polycrystalline diamond
DRI	=	rotation
FAB	=	width of rebate
FAT	=	depth of rebate
FAW	=	bevel angle
FLD	=	flange diameter
f_z	=	tooth feed
$f_{z\ eff}$	=	effective tooth feed
GEW	=	thread
GL	=	total length
GS	=	Plunging edge
H	=	height
HC	=	tungsten carbide, coated
HD	=	wood thickness (thickness of workpiece)
HL	=	high-alloyed tool steel
HS	=	high-speed steel (HSS)
HW	=	tungsten carbide (TCT)
ID	=	ident number
IV	=	insulation glazing
KBZ	=	abbreviation
KLH	=	clamping height
KM	=	edge breaker
KN	=	single keyway
KNL	=	combination pinhole consists of 2/7/42 2/9/46,35 2/10/60
L	=	length
l	=	clamping length
LD	=	left hand twist
LEN	=	Leitz standard profiles
LH	=	left hand rotation
M	=	metric thread
MBM	=	minimum order quantity
MC	=	multi-purpose steel, coated
MD	=	thickness of knife
min^{-1}	=	revolutions per minute (RPM)
MK	=	morse taper
m min^{-1}	=	metres per minute
m s^{-1}	=	metres per second
n	=	RPM
$n_{max.}$	=	maximum permissible RPM
NAL	=	position of hub
ND	=	thickness of hub
NH	=	zero height
NL	=	cutting length
NLA	=	pinhole dimensions
NT	=	grooving depth
P	=	profile
POS	=	cutter position
PT	=	profile depth
PG	=	profile group
QAL	=	cutting material quality
R	=	radius
RD	=	right hand twist
RH	=	right hand rotation
RP	=	radius of cutter
S	=	shank dimension
SB	=	cutting width
SET	=	set
SLB	=	slotting width
SLL	=	slotting length
SLT	=	slotting depth
SP	=	tool steel
ST	=	Cobalt-basis cast alloys, e.g. Stellit®
STO	=	shank tolerance
SW	=	cutting angle
TD	=	diameter of tool body
TDI	=	thickness of tool
TG	=	pitch
TK	=	reference diameter
UT	=	cutting edges with irregular pitch
V	=	number of spurs
v_c	=	cutting speed
v_f	=	feed speed
VE	=	packing unit
VSB	=	adjustment range
WSS	=	workpiece material
Z	=	number of teeth
ZA	=	number of fingers
ZF	=	tooth shape (cutting edge shape)
ZL	=	finger length

Notes to the Lexicon concerning the diagrams and tables

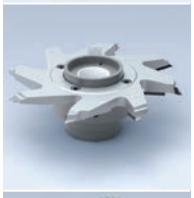

The statements made in the diagrams and tables relate to specific conditions and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

Type of operation

Cutting of the finished size with pre-sized, panel shaped working pieces. Therefore the jointing tools only are peripheral cutting and not with side relief!

Workpiece material

Softwood and hardwood, glulam, chipboard and fibre material, uncoated and veneered, plastic and paper coated.

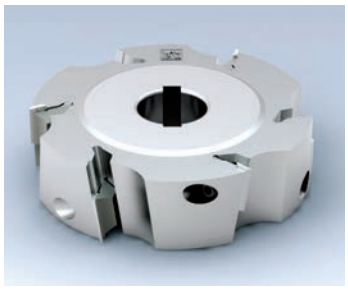

Machines

Spindle moulders, edgebanding machines with sizing part, double end tenoners. Counter milling or jump cutting: Depending on the processing quantity and material, diamond tools or cutterheads with tungsten carbide turnblades are used.

Application

Jointing against feed: For all panel working materials with or without coating.
Jointing with feed: For machining solid wood with heavily irregular course of fibres and risk of tear outs. Only allowed for machines with mechanical feed. Note: Chips are very difficult to remove.
Jump cutting: Jointing with and against feed when cutting across, to prevent tear outs on the front and backside of the workpiece when these are already glued.

Tool Designs

Turnblade cutterhead with alternate shear angle: Suitable for all coated and uncoated panel shaped working materials. Turnblade tools with shear angle produce a curved surface on the workpiece. For exactly straight jointing edges we recommend ProfilCut profile cutterheads with profiled edges (special production) or diamond jointing cutters.

Diamond jointing cutter with alternate shear angle:
S = with symmetrical edge arrangement: Produce a slight hollow section on the milled jointing edge. This has the advantage that the edgebanding on the outside edge close tightly. The tool always must be adjusted symmetrically to the workpiece thickness. The tool can be used in RH and LH rotation.
AS = Asymmetrical edge arrangement: One cutting edge cuts from bottom to top, the top cutting edges all are directed downward which is advantageous for frequently changing material thicknesses.

2-part tools on synchronically adjustable sleeve:
These tools with alternate shear angles are advantageous for high quantities and nearly constant workpiece thicknesses as with increasing tool blunting the jointing edges on the coating do not remain tear-free. The stepless and synchronic adjustment allows the use of multiple performance times and thus an increase of the tool lifetime.

Diamaster WhisperCut

Diamaster WhisperCut – The lightweight and efficient jointing cutterhead for low noise sizing of panel material.

Advantages at a glance:
- Significant noise reduction of up to 5 dB(A) through optimized tool body shape and weight halving
- Trouble free chip ejection and excellent chip collection through DFC technology
- Individual use as per customer requirement: resharpenable or as changing knife system

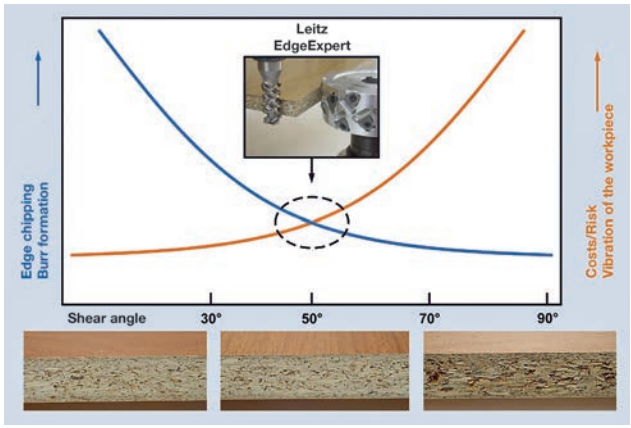

Diamaster EdgeExpert

Diamaster EdgeExpert – The expert for top edge performance especially in case of demanding decors.

In interior design and furniture manufacture, the use of processed material surfaces is increasing in both use and importance. This requires new tool concepts such as the Diamaster EdgeExpert program from Leitz. Whether very thin paper decors, veneers or foil- and high-gloss coating, the Diamaster EdgeExpert enables tear-free edges and even middle layer on continuous machines and CNC machining centres. Especially suitable for zero-joint edging technology with laser, plasma or hot air.

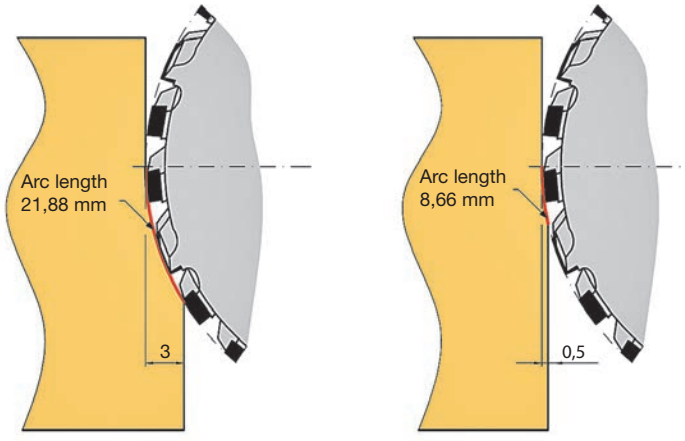

Dust collection

The tool characteristics of the joint cutter Diamaster PRO low noise model range have DFC gullet for delayed chip ejection and are suitable for i-system.

Chip removal

The chip removal has an important influence on the machining quality and on the tool life. Through a reduction of the chip removal, the arched length of the tool positioned in the interference is decreased, causing the tool to cut less material and to increase the tool life.

Noise emission

For noise reduction, LowNoise tools Diamaster PRO with its low knife protrusion, staggered edge and shear can be used. See section Edge Processing - Jointing Cutters.

Service

The Diamaster WhisperCut knives either can be serviced by Leitz Service or by the user on site.

Resharpening Diamaster WhisperCut

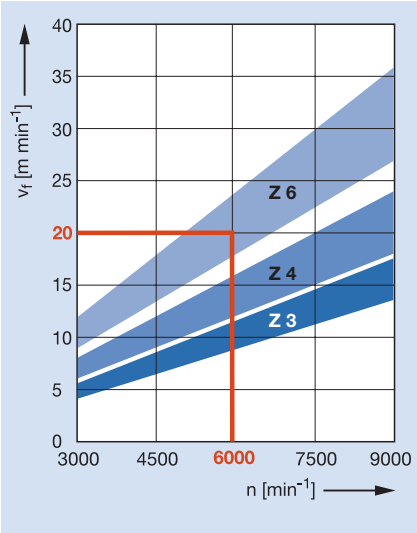

WhisperCut: Diamond knives are resharpenable in the tool body up to 3 times
WhisperCut PLUS: Diamond knives are resharpenable in the tool body up to 10 times

Diamaster WhisperCut – The jointing cutterhead with exchangeable knives

- constant diameter
- quick and easy knife change by the user on site
- no costly adjustment at the machine
- no interchangeable tool required
- optimal knife utilization with small material thicknesses

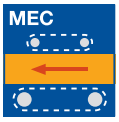

Feed speed related to RPM and number of teeth Z

Material: Chipboard with melamine resin coating

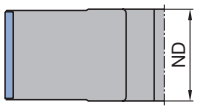

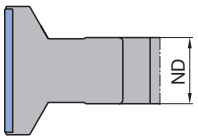

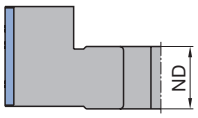

Position of boss (NAL) 1

Position of boss (NAL) 2

Position of boss (NAL) 3

WhisperCut jointing / milling cutter - cutterhead design

Application:
For tear-free and low noise jointing of workpiece edges side with and against feed (jump cutting).

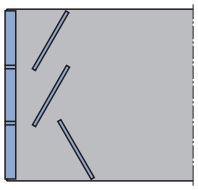

Machine:
Edgebanding machines, copy shaping machines, double-end tenoners etc.

Workpiece material:
Chip and fibre board (MDF etc.) uncoated, veneered, plastic and paper coated, fibre reinforced plastics (GFRP, CFRP etc.).

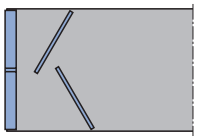

Technical information:
DP tipped cutterhead with alternate shear angle for tear-free jointing edges and cutting surfaces. Tool with knife arrangement S can be used left and right and produces hollow cut for tightly closing edgebanding. Low noise design with up to 5 dB(A) noise reduction and highly efficient chip collection (>95%) by DFC. Significant weight reduction by using an aluminium alloy tool body. Carrier body for multiple use with exchangeable knives. 0.6 mm resharpening area.

Diamaster WhisperCut - DFC, LowNoise, aluminium alloy tool body

WhisperCut EdgeExpert jointing / milling cutter - cutterhead design

Application:
For tear-free and noise reduced jointing of workpiece cutting surfaces with and against feed (jump cutting) particularly for sensitive decorative papers, foil coatings and veneers.

Machine:
Edgebanding machines, copy shaping machines, double-end tenoners etc.

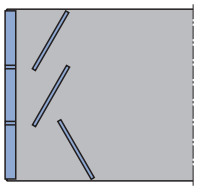

Workpiece material:
Chip and fibre boards (MDF etc.) raw, veneered, painted and coated; especially for plastic, paper, HPL and anti-fingerprint coatings. Also suitable for surfaces in mat, high gloss or with relief structures.

Technical information:
DP tipped cutterhead with alternate shear angle for tear-free jointing edges and cutting surface. Increased shear angle for excellent edge quality on sensitive decorative papers, foil coatings and veneers. Tool with knife arrangement S can be used lefthand and righthand and produces a hollow cut for tightly fitting edgebanding. Noise reduced design with up to 5 dB(A) noise reduction and highly efficient chip collection (>95%) through DFC. Significant weight reduction by using an aluminium alloy tool body. Carrier body for multiple use with exchangeable knives. 0.6 mm resharpening area.

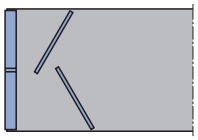

Diamaster WhisperCut EdgeExpert - DFC, LowNoise, aluminium alloy tool body

Jointing / milling cutter on hydro sleeve

Application:
For tear-free and low noise jointing of workpiece edges side with and against feed (jump cutting).

Machine:
Edgebanding machines with zero joint technology.

Workpiece material:
Chip and fibre board (MDF etc.) uncoated, veneered, plastic and paper coated, fibre reinforced plastics (GFRP, CFRP etc.).

Technical information:
Increase of the processing quality through zero clearance hydro adaptor. Tool with alternate shear angle for tear-free jointing edge and straight cutting surface. Low noise design with noise reduction up to 5 dB(A) and highly efficient chip collection (>95%). Tool with knife arrangement S produces hollow cut for tightly closing edgebanding.

Process	Hogging along and across the grain, sizing.
Workpiece materials	Chipboard and fibre materials (MDF) uncoated, with plastic or veneer coating.
Machines	Single sided, double-sided machines and double-end tenoners.
Application	Both sizing processes “double hogging” and “scoring/hogging” require two basic hogging types with different cutting geometries: **Diamaster DT Premium** – Double hogging with feed and negative rake angle and **Diamaster DT Premium Score** – Scoring/cutting with against feed with positive cutting angle.

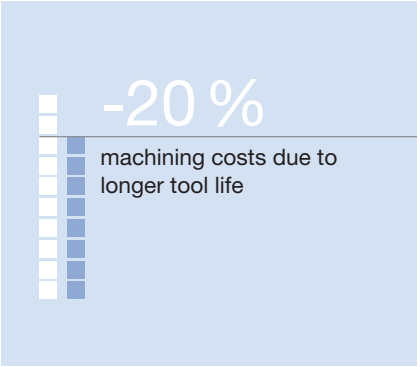

Double hogging: Both hoggers cut with feed.

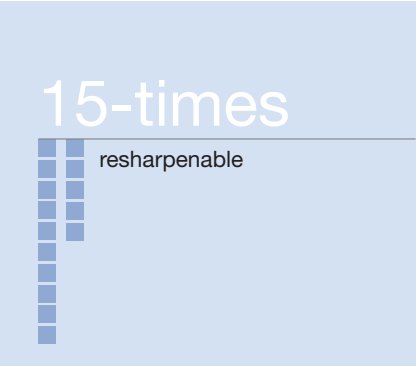

Scoring/hogging: Scoring saw cuts with feed, hogger against feed.

Compact hogger DT Premium	Manufacturers are facing major challenges due to their customers demanding changing quantities as well as requesting a wide variety of carrier and decorative materials to be used in panel production. The new DT Premium compact hogger is the solution for increasing productivity thanks to its long tool life – with perfect quality on the edge and cutting surface.

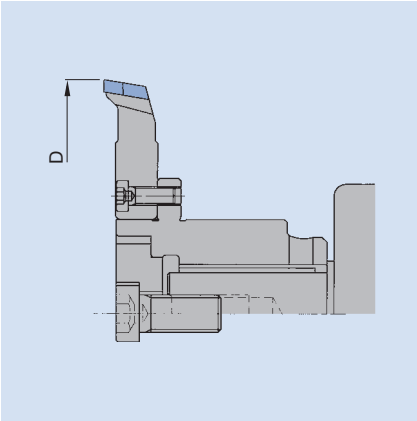

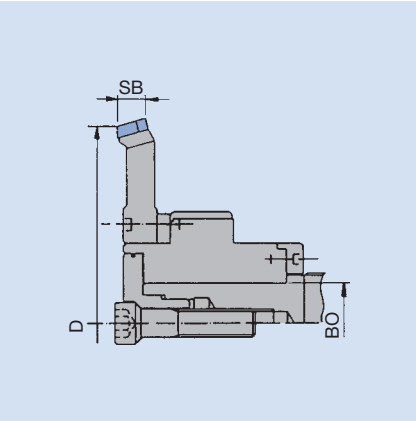

Productivity & efficiency	Maximum economic efficiency through long tool life – Long tool life even under difficult operating conditions thanks to new tooth shape – Reduction of set-up costs due to long tool life – Efficient chip removal due to innovative gullet geometry and integrated chipbreaker – Cost efficient processing of various materials – Ideal also for batch size 1 due to adapted cutting geometries – Resharpenable up to 15 times through larger resharpening area
Quality	Perfect edges and cutting surfaces – Excellent edge quality and smooth cutting surfaces through adapted cutting geometries – Clean workpiece finishes due to efficient chip removal with DFC®-Technology – Constant cutting width over the entire life cycle
Sustainability	Longer tool life time, less dust and noise – Reduced noise due to special tool design – Reduction of noise and vibration through damping elements – Longer tool life time through larger resharpening area

Special information:
Including assembly, machine model

Tooth shape 1 (ZF 1):
For processing different materials (batch size 1), coated wood materials such as HPL, melamine, high gloss.

Tooth shape 2 (ZF 2):
For processing veneers, paper, honeycomb panels.

Diamaster DT *Premium*

Application:
For hogging along and across grain - sizing - especially for **hogging / hogging**.

Machine:
Double-end tenoners, edgebanding machines etc.

Workpiece material:
Chip and fibre board (MDF etc.) uncoated, veneered, plastic and paper coated, light construction panels (honeycomb).

Technical information:
Maximum economic efficiency through long tool life even in different materials (batch size 1). Up to 15 times resharpenable and constant cutting width over the entire life cycle. Perfect edge quality and smooth cutting surfaces through adapted cutting geometries. Clean workpiece finishes due to efficient chip removal with DFC-technology. Hogger as standard with 4 pinholes reference diameter 100 and quick clamping system 160 (BO 60) and 192 (BO 80).

Compact hogger

Application:
For hogging along and across grain - for sizing applications in double hogging process (**hogging / hogging**).

Machine:
Double-end tenoners, edgebanding machines etc.

Workpiece material:
Particle and fibre materials (MDF etc.) uncoated, veneered, plastic and paper coated, lightweight panels (honeycomb).

Technical information:
Resharpenable 10 times. Hogger as standard with 4 pinholes reference diameter 100 and quick clamping system 160 (BO 60) and 192 (BO 80).

Compact hogger

* Recommended feed rate for coated chipboard materials and fibre materials.

Process

Hogging along and across grain with/without scoring sawblades.

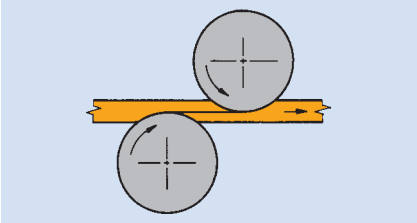

Workpiece materials

Solid wood, wood derived materials and composite materials.

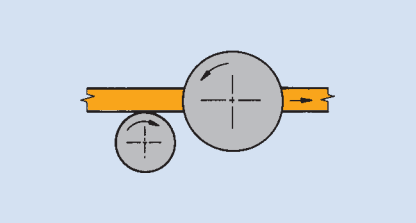

Machines

Multi-rip saws, double-end tenoners, window making machines, edgebanding machines.

Application

Double hogging:
Both hoggers cut with feed.

Scoring/hogging:
Scoring saw cuts with feed, hogger against feed.

Recommended tooth shape hogger sawblades

Cutting width and RPM

Tool*	D/mm	SB/mm	RPM max.
Segment hogger	250	25 – 50	7200 m/min^{-1}
	300	30 – 60	6000 m/min^{-1}
	350	35 – 70	5100 m/min^{-1}

* A larger sawblade diameter is recommended for veneered chipboard, fibre materials and laminated wood (e.g. hogger D 250 mm –> recommended sawblade D 260 mm).

Segment hogger

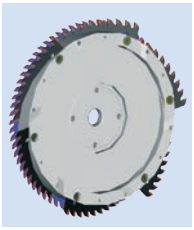

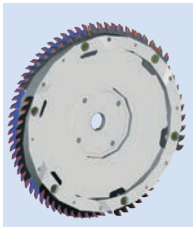

Feed speed v_f in relation to the number of teeth Z and RPM n.

Segment hogger

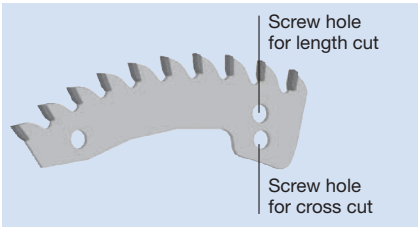

Segment hoggers are a modular design. Segment hoggers are used, depending on the diameter, for hogging widths from 25 to 70 mm. Hoggers or segment hoggers combined with different circular sawblades are suitable for cutting the following materials along and across the grain:
– Solid wood
– Wood derived materials without coating
– Wood derived materials with coating, with veneer, with paper etc.
– Composite materials

Cross cut

Length cut

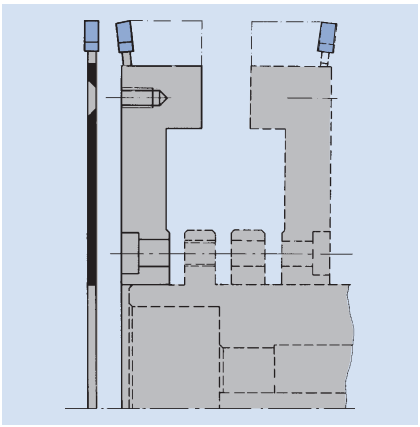

The hogging segments in segment hoggers are set either for length and or cross cut. The cross cut setting reduces the risk of breaking the corner of the workpiece when cross cutting against the feed.
Segment hoggers with up to 12 segments are used for edging and sizing on wood-derived material production lines (e.g. Siempelkamp, Kontra etc.). A special segment hogger design has been developed for the finish cut on wood derived material production lines.

Saw hogger

Saw hoggers, single tools or assemblies with cutting widths of 6.35 - 12.00 mm are used for hogging along and across the grain and to size solid wood on finger jointing machines.

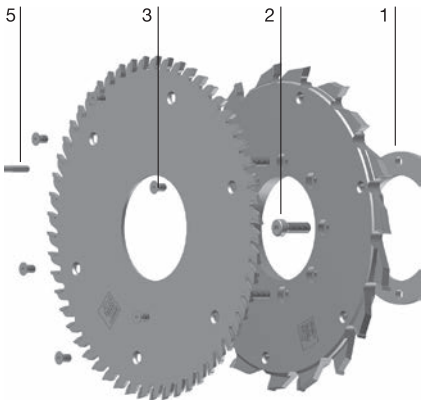

Assembly design/examples

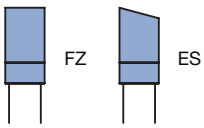

Segment hogger with extension hogger.

Hoggers

Application:
For tear-free sizing along and across grain. Machining against feed only combined with scoring sawblade. Defined trimming in front of the finger cut for adjusting the finger fit.

Machine:
Double-end tenoner, finger joint machine with trimming aggregate.

Workpiece material:
Solid wood and wood derived materials.

Technical information:
Steel tool body with HW circular sawblade and hogger elements mounted on flanged sleeve. Can be extended for larger hogger widths. Single sided bevel tooth shape reduces tear outs.

Grooving with feed

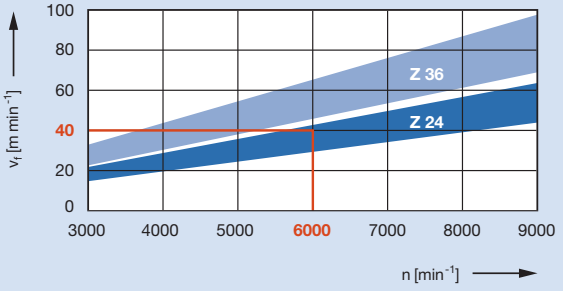

Straight cut composite tool for grooving with feed (MEC).

Cutting rear panel grooves

Feed speed v_f depending on number of teeth Z and RPM n for wood derived materials (top layer)

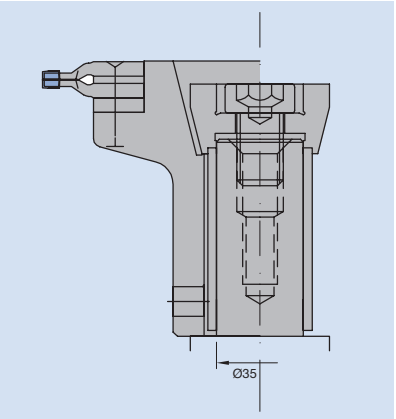

Feed speed v_f depending on number of teeth Z and RPM n for wood derived materials (middle layer)

Grooving against feed

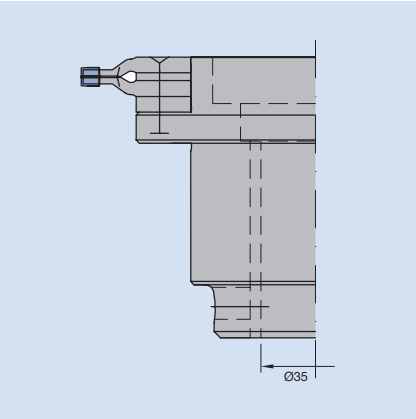

For tear-free cutting of different grooving widths on spindle moulders, moulders, edgebanding machines and double-end tenoners in uncoated and coated wood derived materials.

Adjustment of the cutting width with spacers (adjustment steps 0.1 mm). High chip collection by working against feed. Feed speed up to 40 m min^{-1}. Constant grooving width and distances to the machine chain also after regrinding. Special cutting geometry for tear-free cuts. Suitable to mount on sleeves with bore 30, 35 and 40 mm. Tipping height 6.0 mm.

Tools for grooving against feed available on request.

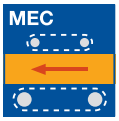

Assembly example:
Spindle 30 KN or DKN

Assembly example:
Spindle 35 KN or DKN

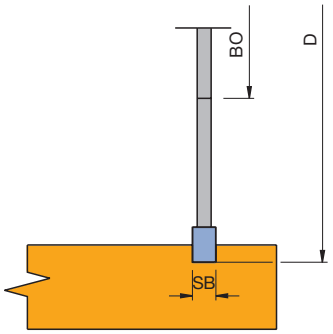

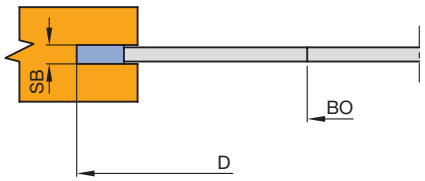

HW

Working processes	Finishing plastic, veneered and solid wood edges of wood material boards. – Pre-cutting to remove asymmetric edge protrusions on top and bottom edges and edge trimming solid wood edges. – Profiling a bevel or round edge on top and bottom edges. – Profiling a bevel and round edges on top and bottom edges and front and back. – Profile scrapers to remove knife marks. – Flat scrapers for excellent alignment of edge and workpiece.
Workpiece material	Thick plastic edgebanding made from PVC, PP, ABS, thin plastic edgebanding made from melamine resin, veneer edgebanding, solid wood banding and edgebanding.
Machines	Single or double-sided edgebanding machines, double-end tenoners.
Application	Against feed for plastic edgebanding, preferably with feed for solid wood edge lippings.
Technical features	Tool and touch roller positions are coordinated, requiring constant tool dimensions. It is recommended not to resharpen edge processing tools.
Chip disposal	Tools with optimised chip collection are designed to the corresponding machines (i-System, ED-System), and guide the chips from the tool cutting edge into the extraction. Even at low extraction air speeds more than 97% of the chips are collected. This improves not only process efficiency and productivity, but also the working environment. New machines require less extraction.

Radius cutter with cylindrical bore

Radius cutter with HSK 25 R adaptor

Radius cutter with HSK 32 adaptor for FK aggregates

Profile cutter with optimised chip collection

Application:
To round edgebandings.

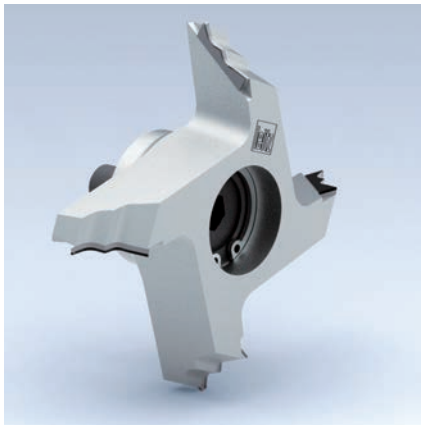

Machine:
Single or double-sided edgebanding machines.

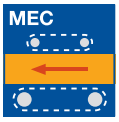

Workpiece material:
Plastic, softwood, hardwood and veneer edgebander.

Technical information:
HW/DP tipped tools designed for systems for controlled chip collection (i-System, ED-System) for highly efficient chip collection (approx. 97%) with reduced energy consumption for extraction. Clean workpieces, no interference with scanning aggregates and less rework. Maximum concentricity. Constant reference diameter. It is not recommended to resharpen the tool.

Alternative multi-profile trimming heads with different dimensions can be supplied at short notice on request.

Multi-profile cutter with optimised chip collection

Application:
For multi-profile cutting with radii and bevelling of edges. Combination of three profiles for automatic profile resetting.

Machine:
Homag edgebanding machines with profile FK31 trimming aggregate.

Workpiece material:
Plastic, softwood, hardwood and veneer edgebander.

Technical information:
Three profiles in one tool. DFC design for highly efficient chip clearance of more than 97%. D_0 = constant reference diameter. Low noise DP tool. Maximum concentricity. Tool change while the spindle is running. It is recommended to have individual tools changed by the Leitz tool service. It is not possible to resharpen the tool.

Profile cutter flexTrim

Application:
For multi-profile cutting with radii and bevelling of edges. Combination of two profiles for automatic profile resetting in the workpiece gap.

Machine:
Homag edgebanding machines with cutting unit type FK11, FK20, FK21, FF12, FF32, PF21 with flexTrim cutting head.

Workpiece material:
Plastic, softwood, hardwood and veneer edgebander.

Technical information:
Two profiles in one tool. DFC design for efficient chip collection. Maximum processing quality through high running accuracy and smooth running. D_0 = constant reference diameter, RPM n_{max} = 18000 min^{-1}. It is recommended to have individual tools changed by the Leitz tool service. It is not possible to resharpen the tool.

DP

Profile cutter flexTrim

Application:
For multi-profile cutting with radii and bevelling of edges. Combination of two profiles for automatic profile resetting.

Machine:
Homag edgebanding machines with cutting unit type MF50, MF60.

Workpiece material:
Plastic, softwood, hardwood and veneer edgebander.

Technical information:
Two profiles in one tool. Alternatively with only one profile. Maximum processing quality through high running accuracy and smooth running. D_0 = constant reference diameter, RPM n_{max} = 12000 min^{-1}. It is not possible to resharpen the tool.

Profile cutter flexTrim3

Application:
For multi-profile cutting with radii on edges. Combination of three profiles for automatic profile resetting.

Machine:
Homag edgebanding machines with cutting unit type FF32 with flexTrim cutting head.

Workpiece material:
Plastic, softwood, hardwood and veneer edgebander.

Technical information:
Three profiles in one tool. Maximum processing quality through high running accuracy and quiet running. D_0 = constant reference diameter, RPM n_{max} = 12.000 min^{-1}. Replacement of tool components only by qualified personnel of the tool or machine manufacturer. It is not possible to resharpen the tool.

Profile cutter Quattro^{Form}

Application:
For multi-profile cutting with radii and bevelling of edges. Combination of four profiles for automatic profile resetting.

Machine:
Holz-Her model Lumina and Accura 2015 and newer models. Application on revolver cutting unit Quattro Form (FF 701 Multi).

Workpiece material:
Plastic, softwood, hardwood and veneer edgebander.

Technical information:
DP composite tool with four profiles and mounting screw. Profiles automatically adjustable by the machine control. Patented system. D_0 = constant reference diameter, RPM n = 18000 min^{-1}. It is recommended to have individual tools changed by the Leitz tool service. It is not possible to resharpen the tool.

Profile cutter Multi-Edge

Application:
For multi-profile cutting with radii of edges. Combination of three profiles for automatic profile resetting.

Machine:
Stefani.

Workpiece material:
Plastic, softwood, hardwood and veneer edgebander.

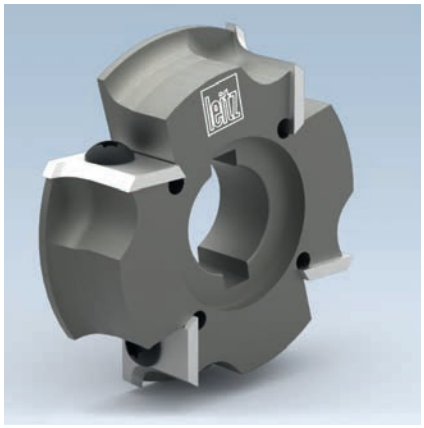

Technical information:
Three profiles in one tool. DFC design for efficient chip collection.
Maximum processing quality through high running accuracy and smooth running.
D_0 = constant reference diameter, RPM n_{max} = 18000 min^{-1}. Tool change while the spindle is running. It is recommended to have individual tools changed by the Leitz tool service. It is not possible to resharpen the tool.

Duo multi-profile scraper Type 1
(all profiles in Duo design)

Duo multi-profile scraper Type 2
(2 profiles in Duo design)

Multi-profile scrapers

Application:
For scraping edgebandings with radii or bevels. Especially for colour fastness and anti-stress whitening for dark edges and high gloss PMMA edges.

Machine:
Single or double-sided edgebanding machines or double-end tenoners.

Workpiece material:
Plastic edgebander as PP, ABS, PMMA etc.

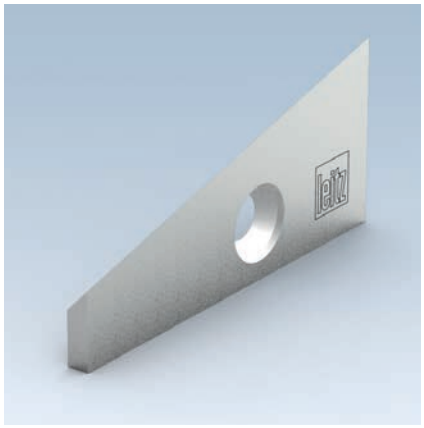

Technical information:
Duo multi-profile scraper with different radii and bevels for 4 profiles in total. Staggered cut on two consecutively arranged scrapers with special micro geometry for high edge quality, colour fastness, high gloss level and without stress-whitening. Especially in conjunction with jointless edgebanding.
Attention: Only applicable on standard scraper aggregates with special profile scraper holders.

Working processes	Production of workpieces with narrow edges for profiling and coating with edging material.
Workpiece material	Chipboard and fibre materials (e.g. MDF boards).
Machines	Single or double-sided soft forming machines.
Procedure	Sizing panel by scoring hogging or double hogging, protection milling, if required. Scoring and removing the coating on the workpiece surface by horizontal spindle. Profiling the narrow edge with vertical, horizontal or inclined spindles. Cutting the edgebanding on the sized side to a precise dimension with the tracing spindle. Edge trimming of the banding on the side banded first with tracing spindle. Scraping, if required.
Important order data	– Profile – Coating thickness – Coating material – Machine side – Number of sides to be coated – Expected profile production volume Given the diversity of products, standard tools and special tools are used in soft forming according to requirements.
Profile examples	
Working process	Production of workpieces with profiled narrow edges with jointless HPL, CPL or veneer surface coating material wrapped around the narrow face.
Workpiece material	Chipboard and fibre materials (e.g. MDF).
Machines	Single or double-sided post forming machines.
Important ordering information	 – Radius and internal radius – Coating thickness – Material thickness – Type of coating – Post forming with or without inlay rod – Machine side R = External radius, e.g. R9 RI = Internal radius, e.g. R8,65

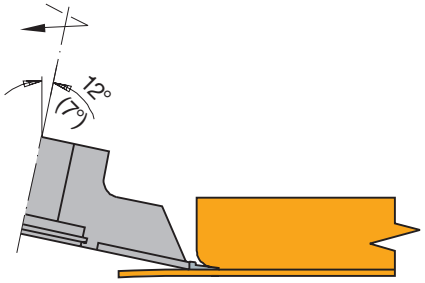

DP

Finish cutting radii up to R 14 mm at 7° and 12° spindle angle

Finishing cutterhead

Application:
To finish cut the radius of postforming profiles.

Machine:
Postforming machines.

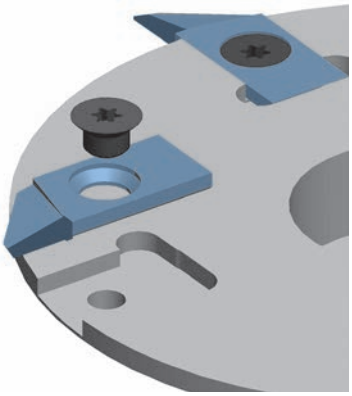

Workpiece material:
HPL, CPL or veneer-coated chip- and fibre boards (particle board, MDF etc.).

Technical information:
Spare knives for cutterhead with DP profile knives and cylindrical bore or HSK 25 R adaptor. Suitable for finish cutting radii up to R 14. Non-resharpenable knives 0.5 mm optimised for sensitive coatings, veneer postforming and maximum contour accuracy.

Segment hogger

The cut edge quality of the sizing and finish cuts depends on the circular sawblades. Tool body in steel or aluminium. Staggered cut with tungsten carbide segments. Assembly on flanged sleeve or direct assembly on the motor spindle without flanged sleeve depends on the design.

Designs

Toolset for finish-production unit with sizing and finish cut

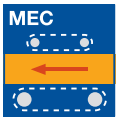

Toolset for sizing unit mounted on flanged sleeve

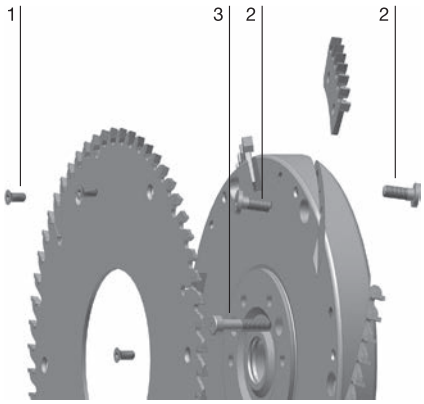

Segment hogger for sizing unit

Application:
For hogging along and across grain with/without scoring sawblade.

Machine:
Sizing station in production lines.

Workpiece material:
Chip and fibre boards (MDF etc.) uncoated, veneered, plastic coated.

Technical information:
The cut edge quality depends on the circular sawblade. Tool body D 305 mm in steel or D 355 mm in aluminium. Staggered cut with six tungsten carbide segments. Build up option with extension hogger unit. For D 305 mm the hogger is mounted directly on the spindle without flanged sleeve.

Problem	Possible cause	Action
Break outs at the edge of the workpiece top edge	– Incorrect height adjustment of hogging motor and tilt in feed direction	Correct setting Check position of tools in feed direction, adjust standard value of 0.1 mm to the panel edge
	– Too much axial play in spindle bearing or damaged bearing	Check motor bearings and tolerances
	– Track vibrates due to low chain tension and damaged guides	Check the chain tension, replace damaged parts
	– Incorrect top pressure adjustment	Check top pressure
	– Run out tolerance too high, possible tool imbalance	Measure tool, correct and check for imbalance
	– Insufficient number of teeth, feed rate too high	Increase number of teeth or adjust feed speed
Break outs at the edge of the workpiece bottom edge	– Workpiece projection too large or thin workpieces	Provide additional support in the tool area
	– Incorrect adjustment in feed direction of scoring or hogging tool	Produce trial sample and adjust motors
	– Scoring sawblade not adjusted to the accuracy required in feed direction or hogging tool tilted too far	Check angles of scoring sawblade and hogging tool in feed direction
Tooth pattern at workpiece edge wavy surface	– Tool position setting angle is too high	Correct the tool setting angle
	– Transport of workpiece not consistent during through feed	Check chain and drive
	– Inconstant workpiece feed rate	Increase number of teeth or adjust feed speed
	– Run out tolerance too high, possible imbalanced tool	Measure tool, correct and check for imbalance
Surface of middle layer rough, uneven (with steps)	– Tool worn, blunt	Repair and service the tool
	– Insufficient number of teeth, feed speed too high	Increase number of teeth, adjust feed speed
	– Adjustment of top and bottom tools (scoring/hogging tool) not level with feed direction	Produce trial sample and adjust motors
	– Adjustment of hogging tool not at correct angle to the track	Check angle with dial gauge on the horizontal moving spindle
	– Incorrect tooth shape of tool and angle geometry	Check and correct
	– Insufficient middle layer quality of the workpiece	Improve by removing resin and sharpening more frequently
Break outs at edge of workpiece end grain, front	– Adjustment of jump head to the hogging tool not level with feed direction	Produce trial sample and adjust motors
Break outs at edge of workpiece end grain, back	– Adjustment of the controlled scoring motor not level with the hogging unit in feed direction	Check movement of the jump scoring motor and correct adjustment to the hogging unit
	– Poor quality of middle layer of workpiece material (large chip flow, poor pressing)	Improve by removing resin and sharpening tools more often
	– Insufficient number of teeth, feed speed too high	Increase number of teeth or adjust feed speed
	– Incorrect tooth shape and angle geometry	Check and adjust through resharpening

Rounding of the cutting edge
When hogging solid wood and wood-derived materials with or without coating, the teeth of the hogging saw-blade and hogger parts are subject to mechanical and chemical wear.

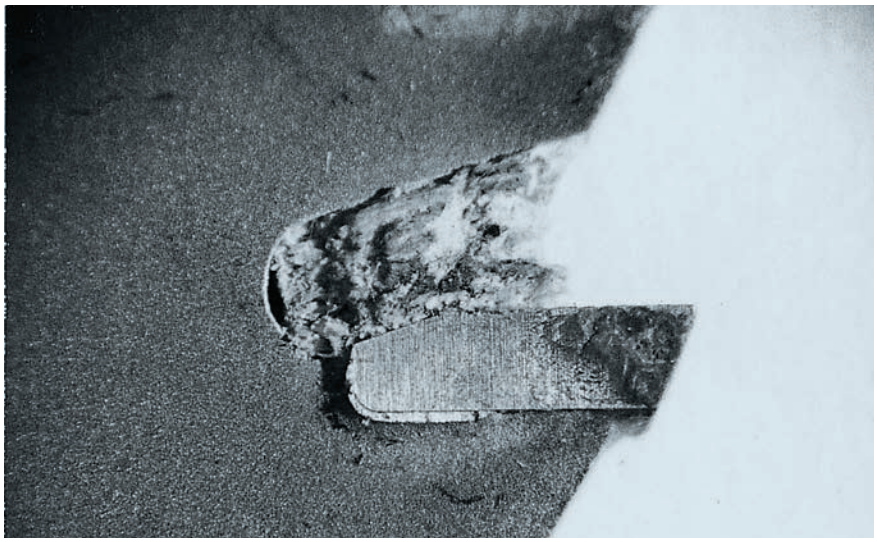

The surface quality determines the size of the cutting edge abrasion. An extremely worn sawblade tooth requires additional sharpening and reduces the number of possible resharpenings.

Typical cutting edge wear when machining solid wood.

Cutting edge destruction through improper use
If the relationship between the number of teeth and feed speed is incorrect, the cutting forces will be too high when hogging solid wood, especially with a high moisture content. This leads to choking the gullet and consequently destruction of the saw tooth.

Action:
Reduce the number of teeth to increase the gullet area; adjust feed speed so the cutting quality is still adequate.

Cutting edge destruction through improper use.

Cutting edge destruction through overstress
If the material to be removed is wider than the cutting width of the hogger, the outside teeth of the raised hogger segments are destroyed by overstress.

The hogging width must always be smaller than the cutting width of the hogging tool.

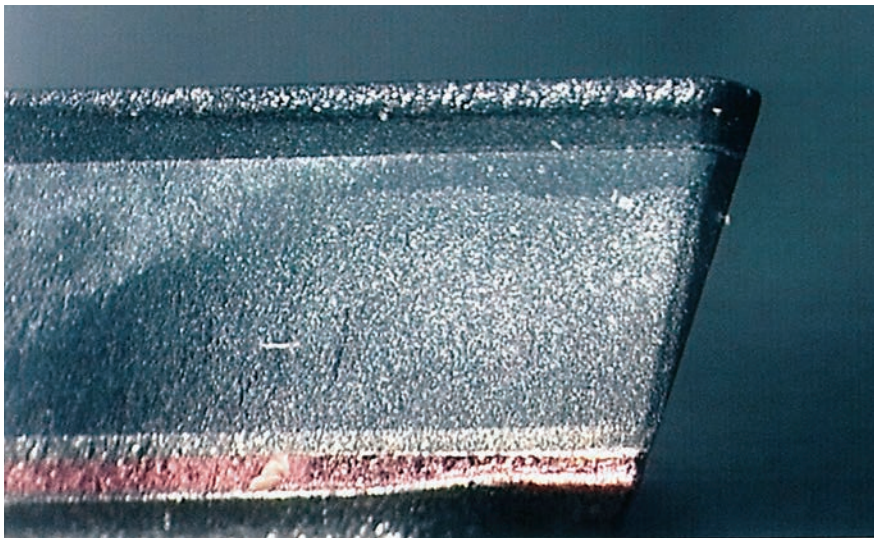

Destruction of saw tooth through overstress.

Rounding of cutting edges
The illustration opposite shows a typical blunt cutting edge, resulting from mechanical abrasion when machining uniform materials.

Removing the resin from the sides of the teeth between resharpening intervals leads to a considerably longer performance time, as it prevents the loss of side relief.

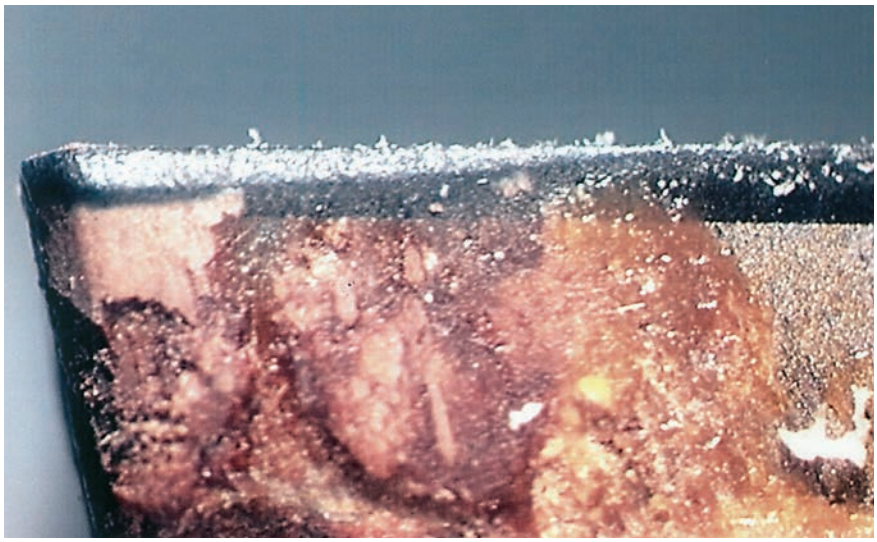

The area of wear should be approx. 0.2 to max. 0.3 mm.

Wear to cutting edges after machining MDF.

Cutting edge rounding and resin build up
Apart from cutting edge wear, a build-up also forms at the side of the teeth from adhesive dust and chip particles (resin build-up) when the workpiece material has a high resin content or the tool has been run for a long time.

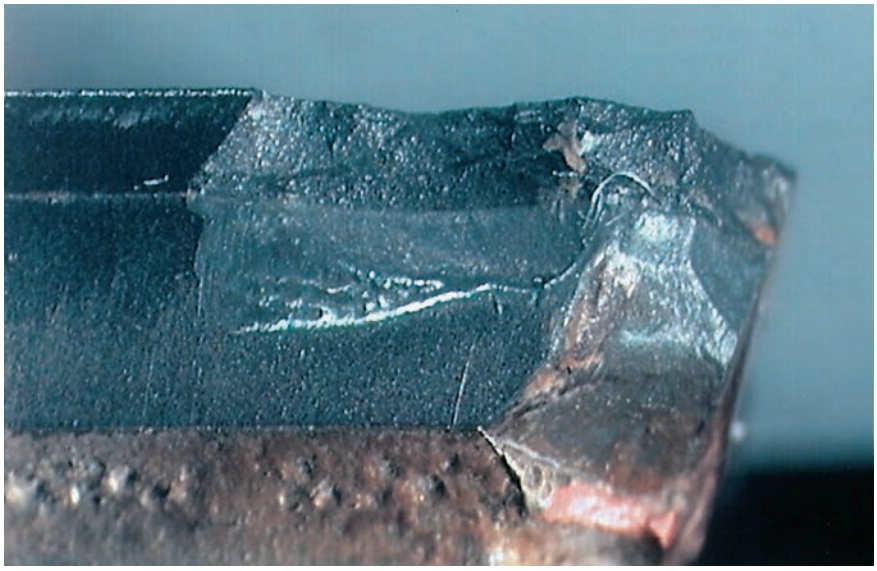

This leads to higher cutting forces and power consumption, low surface and middle layer quality and a considerably reduced tool life.

Wear to cutting edges and resin build-up after machining chipboard.

Cutting edge destruction
The cutting edges can be destroyed when machining workpiece materials with a high sand content, a grain size up to 2 - 3 mm diameter (l) or containing metallic particles.

Using DP (DIA) tools when machining such workpiece materials is problematic and use is not recommended for efficient machining.

Cutting edge destruction from metallic particles.

WSS	=	workpiece material
Z	=	number of teeth
ZA	=	number of fingers
ZF	=	tooth shape (cutting edge shape)
ZL	=	finger length

Notes to the Lexicon concerning the diagrams and tables

The statements made in the diagrams and tables relate to specific conditions and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

Application

Surface-cutting, thicknessing and width planing of workpieces of any length on surface planing machines and planing machines. The workpieces are first planed to get a reference surface. In the second operation they are planed to thickness (dimension) and possibly jointed to get a right angle as second reference surface.

Workpiece material

Softwood and hardwood, dry and wet, chip and fibreboards (e.g. chipboard, MDF), insulating materials, plastics.

Machines

Surface planing and thicknessing machines.

Mounting of long planerheads

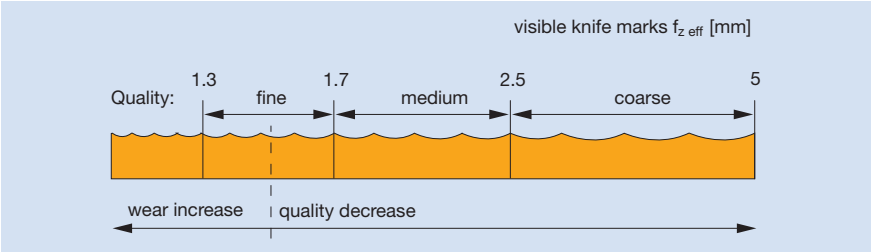

Long planerheads have integrated ball bearings and drive pulleys.

Recommended cutting materials

	HS	Marathon (MC)	HW
Softwood dry	♦	♦	♦
Softwood wet	◇	♦	
Hardwood dry	◇	♦	♦
Hardwood wet	◇	♦	
Plywood		◇	♦
Chipboard			♦
MDF			◇
WPC (Wood-Plastic-Composite)	◇	♦	♦

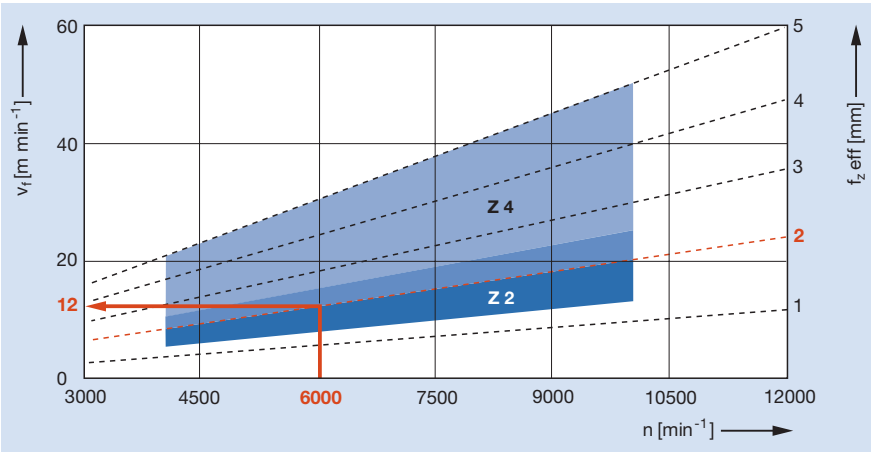

♦ suitable ◇ partly suitable

Feed speed

The feed speed is determined by the required surface quality.
Relation between the surface quality and length of knife marks $f_{z\,eff}$.

Diagram to determine the feed speed v_f depending on RPM n and knife marks $f_{z\,eff}$ for different number of teeth Z*

* Even on tools with several wings, only the marks of one knife show on the workpiece surface (one-knife finish).
Z 2 and Z 4 tools produce the same surface quality under identical machining conditions. (see technical information and charts in section User Manual).

Long planerheads, construction type

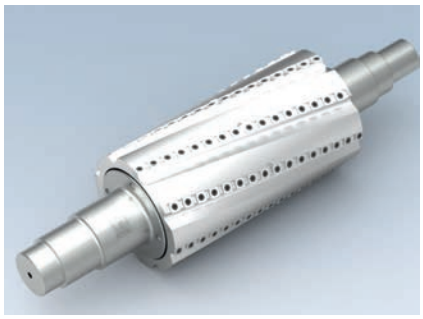

Technical information	Centrofix Plus - long planerhead made of steel. Turnblade system with formfitting centrifugal clamping. Turnblades with integrated chipbreaker for clean finish also in difficult wood types. Fast, precise knife changes with no adjustment.
Cutting material	HW, HS, MC.
Application	For planing softwood, hardwood, insulating materials, plastics.

Technical information	VariPlan - long planerhead made of steel. Resharpenable and constant diameter turnblade system. Self-positioning and centrifugal force supporting knife clamping for easy handling.
Cutting material	HW, HS.
Application	For planing of softwood, hardwood, insulating material, plastics.

Technical information	HeliPlan/HeliCut - long planerhead made of steel. Turnblades can be turned four times. Low noise and energy efficient through spiral and segmented knife arrangement.
Cutting material	HW.
Application	For planing of softwood and hardwood, insulating material, plastics.

Dimensions for long planerheads

(Enter dimensions on drawing or graph)

Sketch for application, special motor spindle etc., side of table to workpiece and fence.

Working process

Planing is the first step after cutting the workpiece to size. It prepares workpiece surfaces and machines a datum surface for accurate workpiece processing.
Pre-planing is recommended prior to profiling on four-sided moulders and multi spindle moulding machines.
Pre-planing and reference heads can be combined on the same spindle to guide the timber through the machine.

Workpiece materials

Softwood and hardwood, dry or wet
Chipboard and wood fibre materials (MDF etc.).

Machines

Four-sided moulders and multi spindle moulding machines.

Tool clamping

Mounted directly on the machine spindle, retained by spindle nut.

Feed speed

The feed speed is determined by the required surface quality.
Relation between the surface quality and length of knife marks $f_{z\ eff}$.

The feed speed is determined according to the quality requirements which can be measured by the produced cuttermarks.
The diagram shows the relation between surface quality and length of knife marks $f_{z\ eff}$.

Planerhead
Z 2 and Z 4

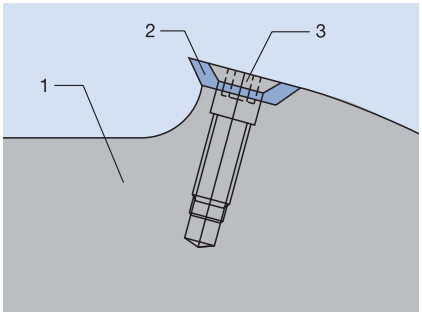

Even on tools with several wings, only the marks of one knife show on the workpiece surface (one-knife finish).
Z 2 and Z 4 tools produce the same surface quality under identical machining conditions (see technical information and charts in section User Manual).

Planerhead HeliPlan

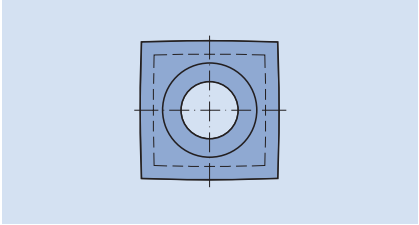

Application	Planing, pre-planing.
Machines	Four-sided moulders and profiling machines or machines with HSK 85 WS interface.
Workpiece material	Softwood and hardwood.
No. of teeth/tool life	2/2 staggered, each HW turnblade knife has 4 lives.
Cutting material	HW.
Chip removal	Softwood: up to 15.0 mm. Hardwood: up to 10.0 mm.
Tool design	Aluminium or steel tool body with spiral, staggered single cutting edges, mounted on the tool body periphery.
Technical features	HW turnblade knives with 4 curved cutting edges.

1) Tool body of steel or aluminium
2) Knives
3) Clamping screw

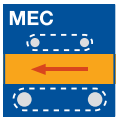

Special advantages	– Minimum breakout. – Noise reduction (up to 10 dB(A)). – The staggered cut reduces both the cutting force and feed pressure. – Turnblade knives have four cutting edges (four lives).
Note	– Barely visible marks in the overlap area; minimal waviness. – As HeliPlan has a staggered cut of individual cutting edges, the tool has limited suitability for producing finished surfaces. Finish planing or profiling may be necessary depending on the quality requirement. – Tool body surface hardening advisable for abrasive workpiece materials. – Use in combination with reference cutterhead WW 410 2 (see page 11) on the first bottom spindle of moulding machines.

HW turnblade knife with 4 cutting edges.

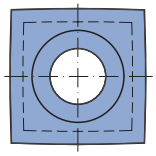

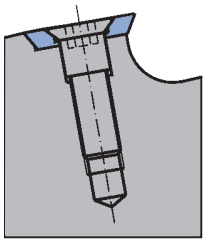

HW turnblade knife

Knives mounted on periphery

Planerhead HeliPlan with 4 edge HW turnblade knives

Application:
Pre-planing, surfacing and jointing all types of wood with large chip removal. Also suitable for finish planing if quality demands are less important or in combination with subsequent sanding.

Machine:
Four-sided moulders.

Workpiece material:
Softwood and hardwood.

Technical information:
Pre-planing cutterhead with 4 edge HW turnblade knives. Low noise and energy efficient due to spiral, segmented edge arrangement. Smooth finish by radiused cutting edges. Aluminium tool body. Optional with steel reference cutterhead for machines with fence.

Aluminium tool body, with bore

Cutterhead for groove bed guide

Application:
For guide grooves on the first bottom spindle for precise feeding of short parts or curved workpieces.

Machine:
Four-sided moulders with groove beds.

Workpiece material:
Softwood and hardwood, along grain.

Technical information:
Build up turnblade knife tool system, diameter and cutting width constant. The closed, round design of the tool body reduces the noise level.

Planing cutterhead VariPlan Plus

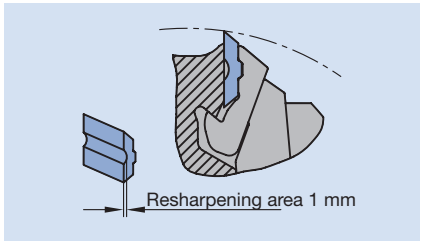

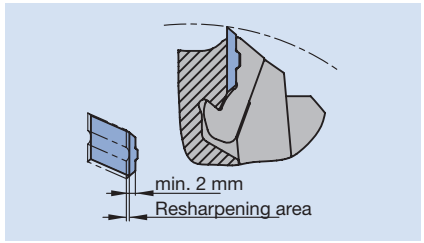

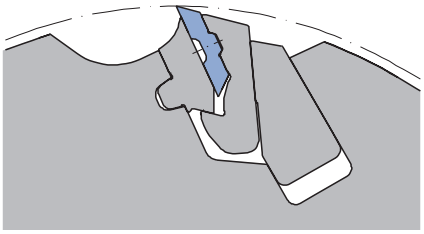

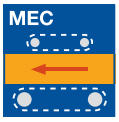

Application	Pre and finish planing of all types of wood.
Machines	Four-sided and multi spindle moulders, also with HSK 85 WS interface.
Workpiece material	Softwood and hardwood, plastics (limited suitable).
Number of knives	Z 2 to Z 12 depending on the feed speed and the tool diameter.
Resharpening area	 
Cutting material	HS for softwood. HW for hardwood, mixed use of softwood and hardwood or laminated wood with glued joint.
Chip removal	Pre-planing: Softwood up to 10 mm, hardwood up to 8 mm. Finish planing up to 1.0 mm.
Tool design	Resharpenable and constant diameter tool system with turnblade planer knives. Aluminium body, wear resistant steel chip breaker. Centrifugal force assisted, self-centering knife clamping system.
Technical characteristics	Operational safety through full form knife clamping. Fast knife change through self-positioning knife clamping. Knife clamping in the dust-protected area. One sharpening operation, therefore 2 extra tool lives by turnblade knife. VariPlan Plus basic body for 3 knife variants: Microfinish, RipTec and Integral turnblade knives. VariPlan Plus Planerheads for machines with HSK 85 WS interface are mounted on HSK 85 WS arbor. Combination with pre surfacing/rebating cutterhead possible.

Aluminium tool body with steel chip breaker.

Planerhead CentroPlan Integral

Application:
For pre-planing on machines with two processing spindles. For pre- and finish planing on one processing spindle.

Machine:
Four-side planing and profiling moulders.

Workpiece material:
Softwood and hardwood with knots and fibre structure difficult to machine.

Technical information:
Centrifugal-supported and form-fitting knife clamping system with turnblades. Light metal tool body. Tool with two CentroPlan ripple knives and two straight CentroPlan planing knives. Unequally pitched cutting arrangement for optimum chip formation.

Planerhead VariPlan Plus Integral

Application:
Versatile application as planing tool:
For roughing and finishing on a processing spindle.

Machine:
Four-side moulders and multi-spindle planing machines.

Workpiece material:
Softwood and hardwood with knots and fibre structure difficult to machine.

Technical information:
Tool with 2 VariPlan ripple knives and 2 straight VariPlan planer knives (constant diameter and resharpenable). Unequally pitched cutting arrangement for optimum chip formation. Light metal tool body. For chip removal > 1 mm.

Application

Finish planing is the last production step on four-sided moulders. The recommended finish planing cutting depth is 0.5-0.8 mm. For good results, a tear-out free pre-planed surface is required.

Workpiece material

Softwood and hardwood.
Chipboard and fibre materials (MDF etc.).

Machines

Four-sided moulders with or without jointing.

Tool clamping

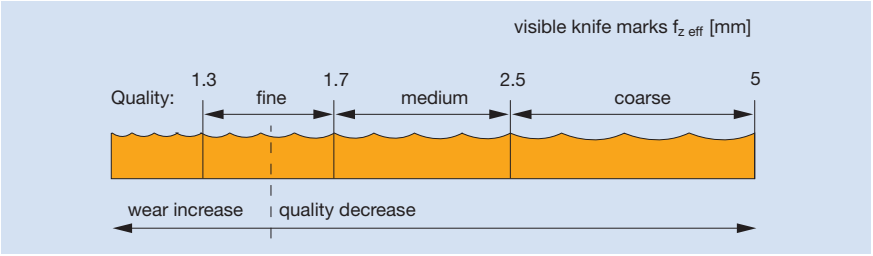

Direct on the machine spindle with spindle clamping nut, with hydro clamping element or with HSK interface.

Recommended cutting

	HS	Marathon (MC)	HW
Softwood dry	♦	♦	◇
Softwood wet		♦	♦
Plywood		◇	♦
Chipboard			♦
MDF			♦
WPC (Wood-Plastic-Composite)	◇	♦	♦

♦ suitable ◇ partly suitable

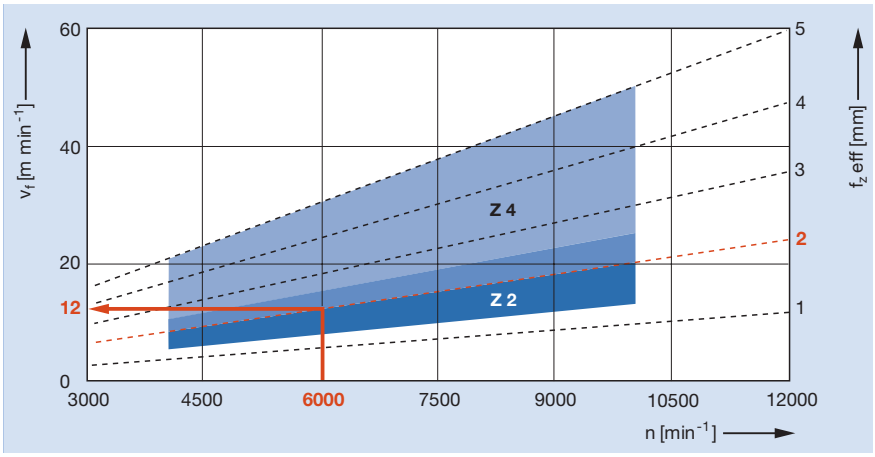

Feed speed

The selection of the feed speed is determined by the required surface quality. See diagram for the relationship between surface quality and length of knife marks $f_{z\ eff}$.

Diagram to determine feed speed v_f depending on RPM n and length of knife marks $f_{z\ eff}$ for different number of wings.

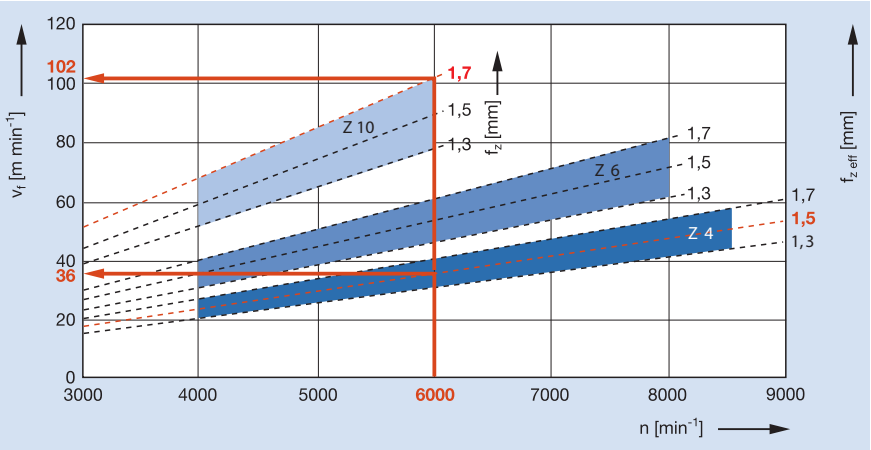

Diagram:
Planing cutterhead
Z 2 and Z 4

Even on tools with several wings, only the marks of one knife show on the workpiece surface (one-knife finish).
Z 2 and Z 4 tools produce the same surface quality under identical machining conditions (see technical information and charts in section User Manual).

Length of cutter marks for jointed hydro planing cutterheads

Diagram:
Hydro planerhead
Z 4
Z 6
Z 10

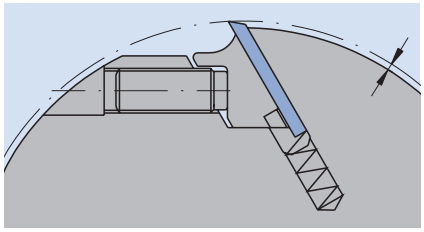

The marks of all knives show on the workpiece in regular pitches on jointed hydro tools. More wings means high feed speeds maintaining the same surface quality (see technical information and charts in section User Manual).

Wedge type system

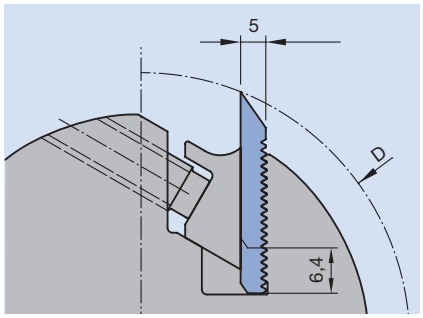

Application	Planing, pre-planing and finish planing.
Machines	Four-sided moulders.
Workpiece material	Softwood and hardwood.
Features of knives	Knife thickness: 3 mm, knife height: 30 mm. Resharpening area: 10 mm.
Cutting material	HS, HW and Marathon (MC).
Chip removal	Softwood: up to 15.0 mm. Hardwood: up to 10.0 mm.
Tool design	Aluminium alloy cutterhead with resharpenable planer knives (SB x 30 x 3 mm). Used on four-sided moulders for pre-planing and finish planing.
Technical information	Cutterhead with compression spring for knife positioning with setting gauge.
Note	 Correct knife projection: maximum 2 mm. – Knives resharpened in the cutterhead for improved run out accuracy and better planing quality. – After resharpening, check the minimum knife clamping height marked on the tool body. – Always tighten the screws from the middle to the outside; setting torque 17 Nm – Check the knife projection (see picture above). Position the planing knife with key and setting gauge. – Mounting the reference head requires two additional holes D 7 mm on a pitch circle diameter of 58 mm and a spacer 3 mm (ID **028617**).

Serrated back planerhead with HSK 85 WS interface

Application	Pre and finish planing.
Machines	Planing machines with HSK 85 WS interface.
Workpiece material	Softwood and hardwood, dry and wet.
Number of wings	Z 2, Z 4, Z 6
Cutting material	Marathon (MC), tungsten carbide HW.
Chip removal	Softwood: up to 12 mm. Hardwood: up to 10 mm.
Feed type	Mechanical feed.
Tool design 	Monobloc steel tool body. High concentricity and balance quality. Seating for 60° serrated back planer knives H = 40 mm x 5.0 mm thickness with standard tooth pitch 1.6 mm.
Resharpening area	9 mm.
Advantages	Pre and finish planing with Marathon planer knives resharpened to one cutting circle. For finish planing with n = 12000 min^{-1} and a feed rate > 18 m min^{-1}, the planer knives require jointing on the machine. After jointing, all knives will have the same cutting circle.
Note	Cutting angle 20° for softwood. Cutting angle 12° for hardwood and wood fibre materials. Jointing with n = 10000 min^{-1}.

Hydro planerhead

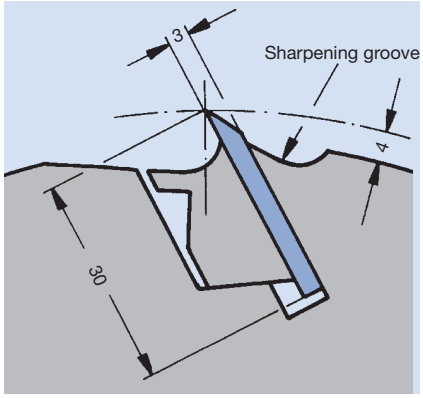

Application	Surfacing, pre-planing and finish planing for feeds from 24 to 120 m min^{-1}.
Machines	Multi spindle moulders, with jointing if required.
Workpiece material	Softwood and hardwood.
Number of wings	Z 4 to Z 12 depending on the diameter.
Cutting material	HS, HW and Marathon (MC 33).
Chip removal	Pre-planing: up to 5.0 mm. Finish planing: up to 0.8 mm.
Tool design	Steel cutterhead with hydraulic clamping, open hydro clamping system with resharpenable planer knives resharpened in the cutterhead for concentricity < 0.005 mm.
Technical features	Jointed knives for excellent surfaces at high feed speeds. Maximum joint bevel width: for softwood 0.5 mm, for hardwood 0.7 mm. High running accuracy and low vibration from hydro clamping. High feed speeds depend on the number of wings and RPM (see page 24, Diagram to determine feed speed).

Note

- Hydro clamp only on spindle.
- Clamp to spindle with clamping collar.
- For knives 30 x 3 mm (35 x 3 from diam. 203 on) HS, HW and MC.

Sharpening groove on the body behind knife for easy knife resharpening in the cutterhead on sharpening machines.

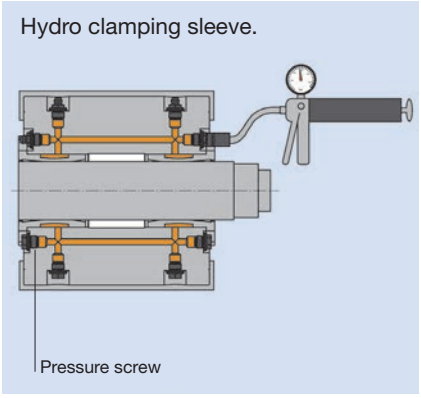

Illustration of hydro clamping system.

TurboPlan Plus hydro planerhead

Application	Pre-planing and precision finish planing feed from between 160 to 360 m min^{-1}.
Machines	High performance moulders with precision spindles and counter bearing.
Workpiece material	Softwood and hardwood.
Diameter/ Number of wings	D 200 to D 360. Z 4 to Z 32.
Cutting material	Marathon (MC 33).
Chip removal	Pre-planing: 5.0 mm. Finish planing: 0.8 mm.
Resharpening area	10.0 mm.
Tool design	Hydro planerhead with steel body. Open hydro clamping system. Integrated balancing segments, attached to body. Form fitting knife clamping: Resharpenable knives with serrated back in Leitz Marathon design. Central knife clamping by open hydro system.
Technical features	For Leitz serrated back Marathon knives HS 30 x 5.0 mm. High concentricity and low vibration from hydro clamping system. Knives resharpened in automatic resharpening machines have a concentricity < 0.005 mm.
Tool clamping	Hydro clamping system.
Knife clamping	Form fitting design, hydro clamping.
Note  scheme 4	Jointed knives give an excellent finish at high feed speeds. Do not pressurise the hydro clamping system without mounting the tool on the spindle. Working pressure 350-450 bar – check daily. Spindle safety – use locking collars to reduce the risk of the tool spinning and cold welding on the spindle. For Leitz serrated back knives Marathon (MC) 30 x 5 mm.

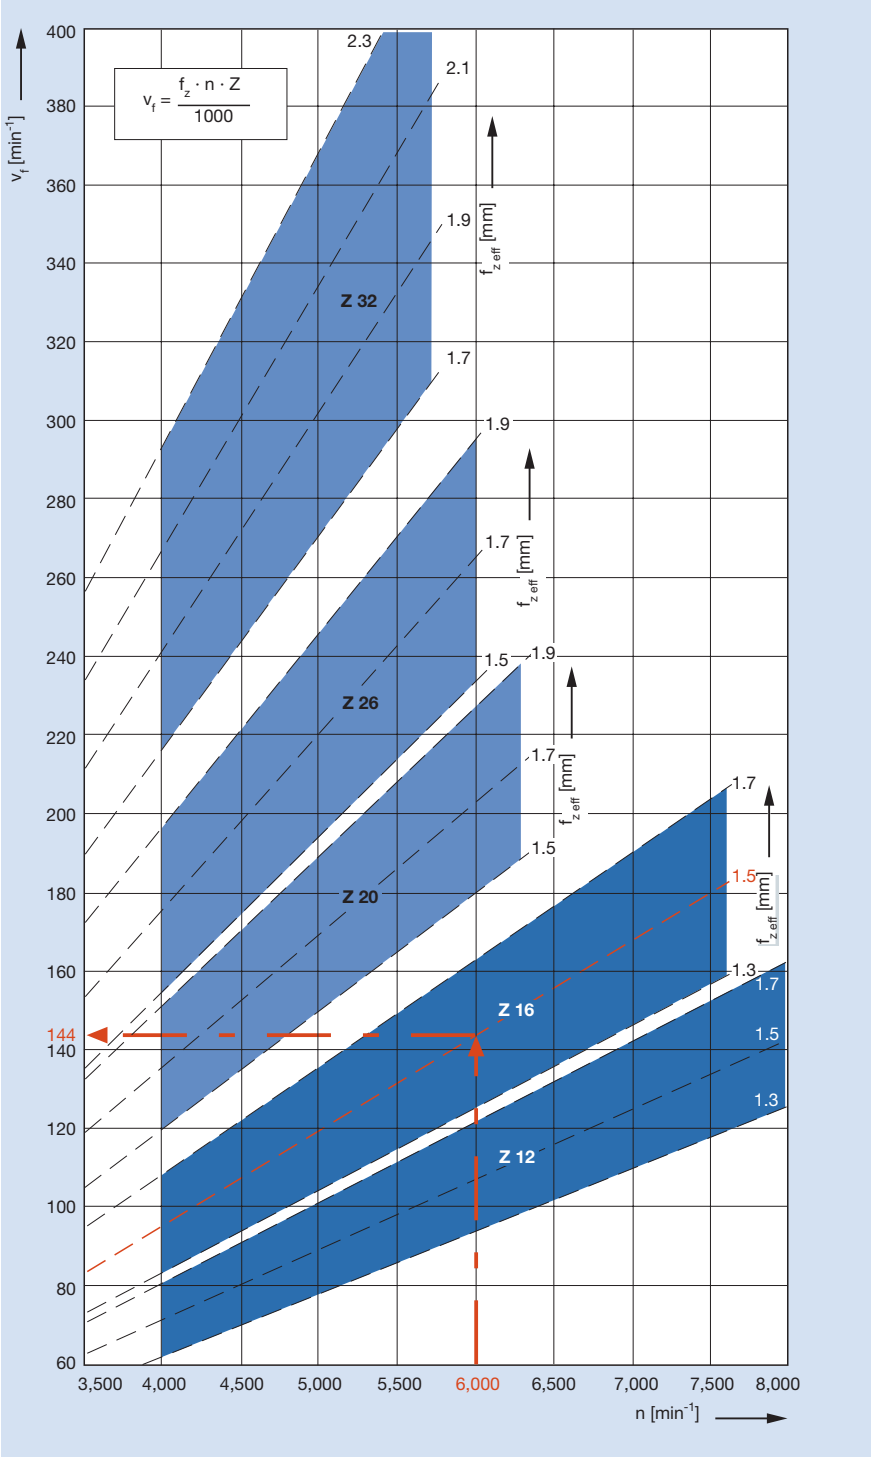

Hydro planerheads – TurboPlan Plus

Diagram to determine feed speed v_f of jointed hydro planerheads depending on RPM n and knife marks $f_{z\,eff}$ different number of wings Z*

Diagram:
Hydro planerhead
RotaPlan and TurboPlan

Z 12
Z 16
Z 20
Z 26
Z 32

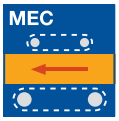

The feed speed is determined by the required surface quality (length of knife marks $f_{z\,eff}$) and depends on the RPM and the number of wings in the cutterhead. The relation can be found in the diagram below.

With jointed hydro tools the marks of all knives are shown on the workpiece in regular pitches. More wings mean higher feed speeds maintaining the same surface quality.

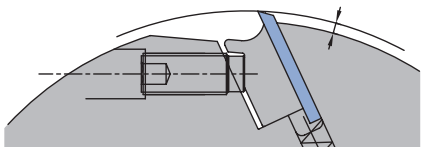

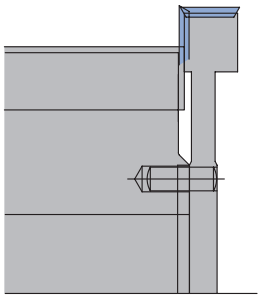

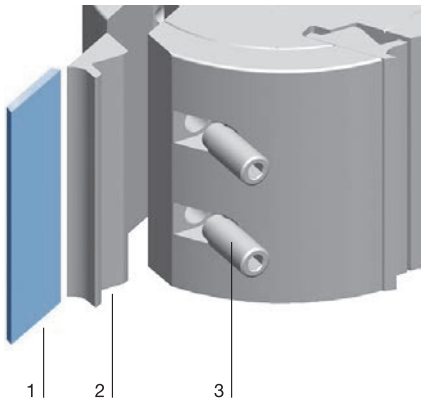

Correct protrusion: max. 2 mm

Combined with reference cutterhead

Planerhead wedge-type system

Application:
Multi-purpose suitable for pre-planing with large chip removal and for finish planing.

Machine:
Four-sided moulders and profile machines.

Workpiece material:
Softwood and hardwood.

Technical information:
Cutterhead with resharpenable planer knives SB x 30 x 3.0 mm. Pressure springs position the knives by a setting gauge on the defined cutting edge circle. Cutting material quality HS, Marathon (MC33) and HW available.

Planerhead with HSK 85 WS and serrated back HS Marathon planer knives

Application:
Finish planing.

Machine:
Four-sided moulders with HSK 85 WS interface.

Workpiece material:
Cutting angle 20° for softwood and hardwood in general.
Cutting angle 12° for materials likely to splinter such as oak, Douglas fir, merbau and wood fibre materials, e.g. MDF.

Technical information:
Finish planing cutterhead in mono block design DTK 90 mm with serrated back planer knives SB x 40 x 5 mm ground to cutting circle. Jointable by specific jointing stone. Steel tool body. High balance quality by assembly with parts of the same weight.

Cutting angle 20°

Mounted knife

Hydro planerhead

Application:
Pre and finish planing with high feed speeds.

Machine:
Four-sided moulders and profile machines with jointing equipment.

Workpiece material:
Softwood and hardwood.

Technical information:
Steel tool body with corrosion resistant surface protection. Integrated hydro clamping system with exchangeable clamping sleeves. Activated by a grease gun. Inclusive resharpenable HS planer knives (SB x 30 x 3 mm). From diameter 203 mm, knives with 35 mm height also can be used. Hydro planerheads can only be used in combination with a clamping collar.

TurboPlan PLUS knife clamping

Hydro planerhead TurboPlan PLUS

Application:
Pre and finish planing with high feed speeds.

Machine:
High performance planing machines with precision spindles and counter bearing as well as a jointing unit.

Workpiece material:
Softwood and hardwood.

Technical information:
Tool body in weight optimized design with two independent hydro systems for the tool and knife clamping. Activated by a grease gun. Marathon coated planer knives with back serration (SB x 30 x 5 mm). Hydro planerhead can only be used in combination with a clamping collar.

Planerhead VariPlan Plus/ ProFix F

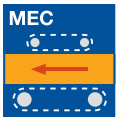

Application	Four-sided moulders for planing, grooving or profiling in one process step. The combination of planing knives and profiling knives allows the planerhead to be used as a multi-purpose planing and profiling tool.
Machines	Four-sided moulders.
Workpiece material	Softwood and hardwood.
Cutting material	Planing knives HS / HW. Profile knives HW.
Number of wings	Z 2+2 seatings for radius, bevel, grooving or profile knives.
Resharpening area	Planer knife 1.0 mm, profile knife 4.5 mm
Chip removal	Softwood: up to 10.0 mm. Hardwood: up to 7.0 mm.
Tool design	Lightweight aluminium cutterhead with resharpenable turnblade planing knives. Clamping system with constant profile and constant diameter (see introduction VariPlan Plus and ProFix cutterhead).
Technical features	 Axially adjustable profile knives can be adjusted to the corresponding wood width/height. Profile depths up to 25 mm and working widths up to 120 mm possible. Cutterhead with lightweight aluminium tool body and steel chip breaker.
Accessories	Bevel, grooving, fluting knives; two left and two right knives per set. 
Note	– Quick change of VariPlan Plus knives in radial direction. – Quick change and adjustment of ProFix profile knives in axial direction. – Special profile knives on request.

Planerhead CentroPlan / ProFix

Application:
For planing and profiling e.g. grooving, bevelling, rounding or profiling in common.

Machine:
Four-side planing and profiling moulders.

Workpiece material:
Softwood and hardwood.

Technical information:
Centrifugal-supported and form-fitting knife clamping system with turnblades. Axial or radial knife removal. Light metal tool body. With knife seatings for ProFix F profile knives (PT max. 25 mm, SB max. 100 mm).

Profile variations

Tongue and groove profiles are used on wall, ceiling and floor panels.
The profiles are standardised and different in each country.
The tools for machining solid wood panels presented on the following product pages are the most common designs in Europe.
The majority of tools for wall and ceiling panel machining are produced to customer specifications.

Workpiece materials

Softwood and medium hardwood.

Machines

Four-sided moulders with feed speeds up to 80 m min^{-1}.
Machines with high precision spindles and jointing units for feed speeds up to 300 m min^{-1}.

Application

Machining against feed, panel face down. Groove right, tongue left.
Groove machined either as a part of the groove profile or separately on a horizontal spindle.

Tool design

HL solid cutter:
HL solid cutters are form ground with a large resharpening area.
Suitable for softwood such as spruce or fir. The main application is high speed moulders for producing standardised tongue and groove boards in high quantities and with high quality requirements.

HW/HS-tipped tools:
HW/HS-tipped tools have a smaller resharpening area of approx. 5 mm depending on the tipping thickness. HW/HS-tipped tools are suitable for softwood and hardwood. They are mainly used on small volume moulding machines with frequent profile changes.

Design of grooving and tongue cutter sets

Tongue and groove cuttersets are of 2 part, adjustable.

Tongue cutter:
Always wing on wing.

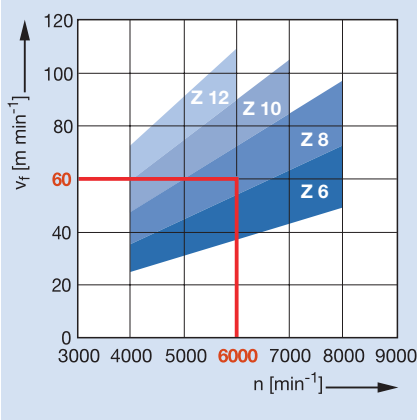

Grooving cutter:
two designs –
wing on wing or
wing on gullet

Wing-on-wing design:
With the wing-on-wing design, the two parts of the cutter set are positioned with the cutting edges on top of each other and the gullets in line so the two parts can be resharpened simultaneously.
Advantage: Resharpening simpler and greater resharpening area.
Disadvantage: Only every other groove wing is cutting the groove flank.
For a Z 6 groove cutter, only three groove wings are cutting each side of the groove.
Tear-outs can occur at high feed speeds.

Wing-on-gullet design:
Unless indicated otherwise, Leitz delivers wing-on-gullet design as a standard.
With this design, the two cutter parts are adjusted so that the wings of one part lie in the gullets of the other part.
Advantage: All the wings are constantly working on the groove side.
This design is preferable for high feed speeds.

Relation between feed rate, RPM and number of wings

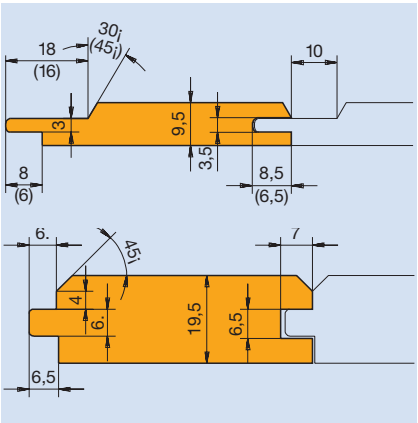

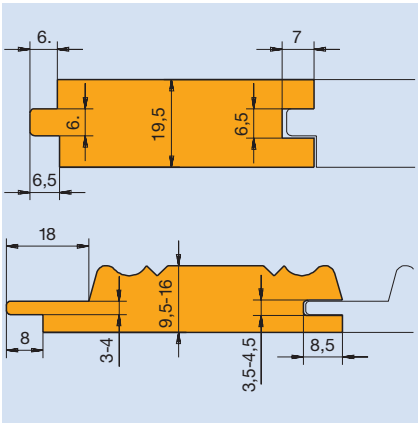

For tools without hydro clamping, only the marks of one knife show on the surface (one-knife finish).
When calculating the maximum feed speed, only one cutting edge can be taken into account.
If the tool is clamped with a hydro clamping system and the profiling is resharpened to a concentricity of at least 0.01 mm, all cutting edges are equally involved in the cutting process and can be taken into account when calculating the maximum feed speed.

Tongue and groove cutter, HL solid / HS tipped

Application:
For tongue and groove profiles on wall and ceiling panels.

Machine:
Four-sided moulders.

Workpiece material:
Softwood, along grain.

Technical information:
Tongue and groove cutterset with spacers for adjustment to different wood thicknesses and tongue and groove widths. BO 60 for use on hydro sleeve for high feed speeds and machining qualities. HL profile cutter with form ground clearance and large resharpening area; HS tipped design with straight clearance.

Profile cutterhead set ProfilCut Q - bevelling / rounding

Application:
Multi-purpose tool set for bevelling, rounding and jointing the workpiece edges at the same time.

Machine:
Spindle moulders, copy shaping and moulders, double-end tenoner.

Workpiece material:
Softwood and hardwood.

Technical information:
With a combination of jointing and bevelling/rounding cutterheads, different profiles and wood thicknesses can be machined. Profile knives with different radii/bevels can be mounted in one cutterhead.

Process steps

The cutterheads presented in the following section are suitable for a variety of profiles in the craft and industrial sectors.
Due to the different application possibilities, the use of the tool and wood types to be machined are detailed on the respective product pages.

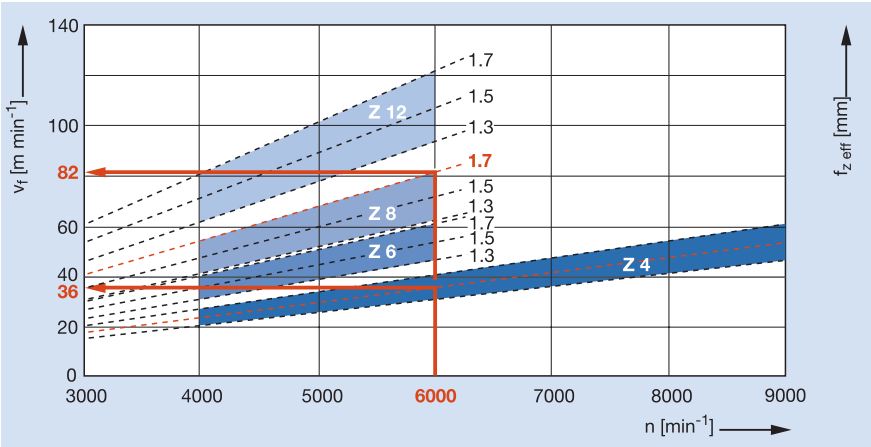

Relation between surface quality and length of knife marks $f_{z\ eff}$

Cutterhead without hydro clamping: Feed speeds depending on RPM, length of knife marks and number of wings

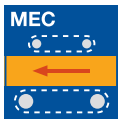

Cutterhead with hydro clamping: Feed speeds depending on RPM, length of knife marks and number of wings

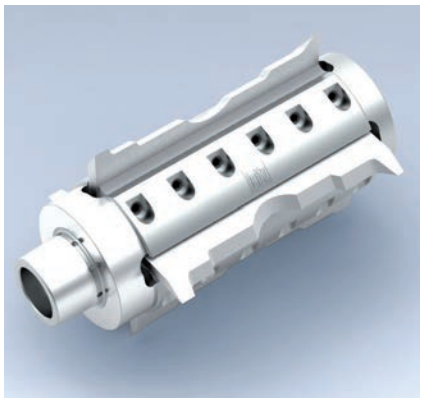

Profile cutterheads for serrated back blank knives

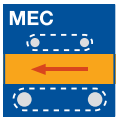

Application	Multi-purpose profiling, machining along grain.
Machines	Four-sided moulders and profiling machines.
Workpiece materials	Softwood and hardwood.
Number of teeth	Z 2, Z 4.
Cutting material	Marathon (MC), HW.
Resharpening area	10.8 mm (9 + 1.8 mm) Marathon (MC) and HW blank knife with backing plate.
Feed	Four-sided profiling.
Tool design	Steel tool body. High concentricity and balance. Knife seat for serrated back knives in HS and MC 33, thickness 8 mm, and HW and HW PowerKnifeSystem (MicroSystem blank knives), total thickness 10 mm (HW blank knife and backing plate). Standard pitch 1.6 mm.
Advantages	Optimal cutting speed with n = 12,000 min-1 and thus improved finish quality. For optimal finish quantity we recommend to grind in the profile blanks in the cutterhead and joint them additionally on the machine.
Note	Cutting angle 20° for softwood. Cutting angle 12° for hardwood and wood fibre materials. PowerKnifeSystem (HW MicroSystem) blank knives with a knife height of 70 mm can only be used for cutting widths up to 150 mm. For jointing: resharpened concentricity of < 0.005 mm.

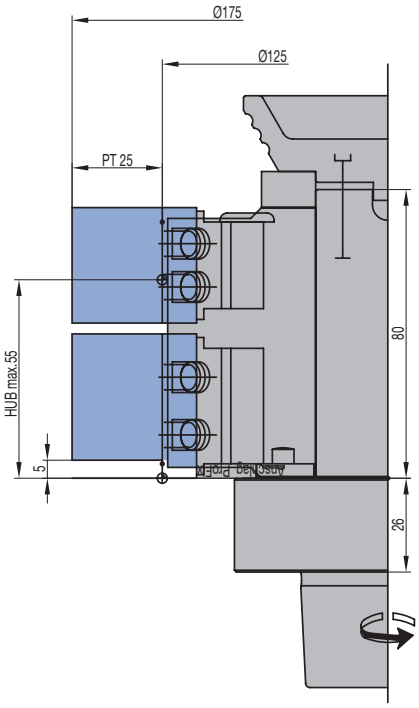

Profile cutterhead ProFix F

Application:
Flexible profiling of different profiles, suitable for panel production.

Machine:
Four-sided moulders and profile machines.

Workpiece material:
Softwood and hardwood, with grain.

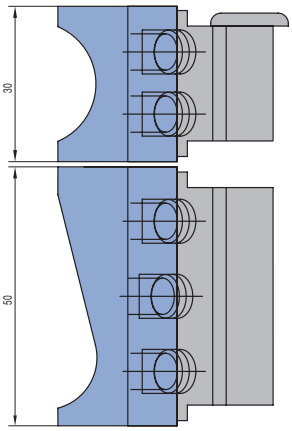

Technical information:
Resharpenable, diameter and profile constant tooling system. Easy profile adjustment through knife change. No tool measurement required. To adapt ProFix F knives with 4.5 mm resharpening area and a profile depth of 25 mm maximum Lightweight aluminium tool body. Division of maximum cutting width to several knives possible.

Profile cutterhead VariForm

Application:
For cutting profiles. Different profiles with maximum 20 mm profile depth can be mounted.

Machine:
Moulders, double-end tenoners, edgebanding machines etc.

Workpiece material:
Softwood and hardwood (HW-30F), panel materials or glued wood (HW-10F).

Technical information:
Multi-purpose cutterhead for MEC feed with tungsten carbide special profile knives and backing plates.
Resharpenable 3 to 4 times.

Partly profiled tool body, MEC feed, Z 2 - Z 4 U profile

Profile cutterheads for serrated back blank knives

Application:
For multi-purpose profiles in hard and/or materials likely to splinter.

Machine:
Four-sided moulders.

Workpiece material:
Cutting angle 20° for softwood and hardwood in general.

Technical information:
Profile cutterhead with 60° serration, 1.6 mm pitch. Steel tool body. Blank knives with knife thickness 8 - 10 mm and knife heights of 40 - 70 mm can be used depending on required profile depth. Cutting materials: Marathon (MC) and HW.

Hydro profile cutterhead for serrated back blank knives

Application:
Cutting of multi-purpose profiles with high feed speeds.

Machine:
Four-sided moulders and profile machines.

Workpiece material:
Softwood and hardwood.

Technical information:
Profile cutterhead with 60°-serration, 1.6 mm pitch. Steel tool body with corrosion resistant surface protection. For blank knives with 8 - 10 mm knife thickness and 5 mm (see table) and 40 - 70 mm knife height, depending on the required profile depth. Integrated hydro clamping system with exchangeable clamping sleeves. Activated by a grease gun. Hydro profile cutterheads can only be used in combination with a clamping collar.

Table to determine maximum profile depth.
The profile depth figures are to be regarded as standard values. The maximum profile depth depends on the tool diameter and cutting angle.

Profile cutterhead with HSK 85 WS for serrated back blank knives

Application:
For multi-purpose profiles in hard and/or materials likely to splinter.

Machine:
Four-sided moulders with HSK 85 WS interface.

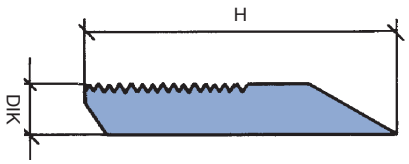

Workpiece material:
Cutting angle 20° for softwood and hardwood in general.
Cutting angle 12° for materials likely to splinter e.g. oak, Douglas fir, merbau and wood fibre materials, e.g. MDF.

Technical information:
Profile cutterhead with back serration, 1.6 mm pitch, with integrated HSK.
Blanks with knife thickness 8 - 10 mm and knife heights of 40 - 70 mm can be used depending on the required profile depth. Cutting materials: Marathon (MC) and HW. Steel tool body. High balance quality by assembly with parts of the same weight.

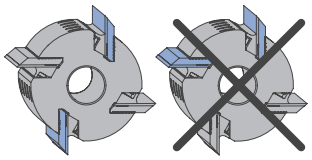

Cutting angle 20°

Process step	Cutting high-strength finger joint profiles for longitudinal jointing of workpieces. The finger profiles meet the requirements of the testing institutes.
Machines	Single and double side finger jointing machines with and without cut-off saw or scoring saws, double-end tenoners, compact finger joint lines, cross profile and standard machines.
Tools	For finger joint machines without cut-off saw: Use minifinger tools with the following finger lengths: 10/10, 15/15 or 20/20 mm. For finger joint machines with cut-off saw: Use minifinger tools with the following finger lengths: 10/11, 15/16.5 or 20/22 mm.

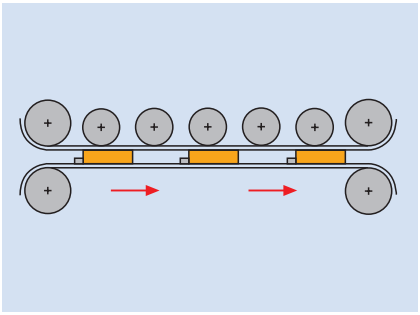

Minifinger jointing machine with cut-off.

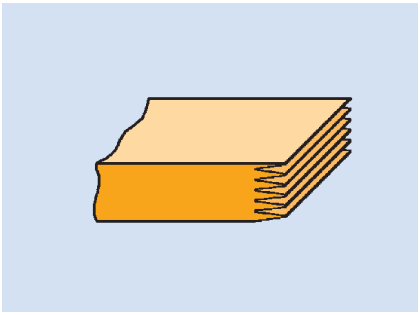

Vertical finger jointing machine/stack machine.

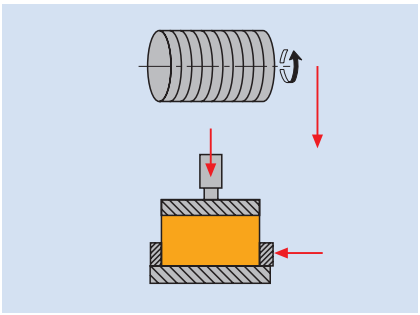

Vertical finger jointing.

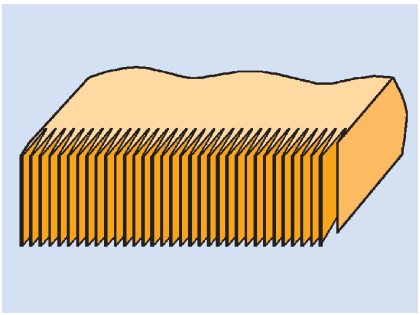

Horizontal finger jointing line.

Horizontal finger jointing.

Compact finger jointing line.

Compact finger jointing.
Vertical finger jointing with horizontal spindle.

Feed rate	Depending on the spindle RPM, no. of wings, workpiece material and condition of the minifinger tooling cutting edges.
Workpiece materials	Coniferous wood and hardwood, softwood and hardwood, Exotic wood, glulam (limited).

Recommended cutting material

	HS	Marathon (MC)	HW
Coniferous wood soft	♦	♦	◇
Coniferous wood hard		♦	♦
Deciduous wood soft		♦	♦
Deciduous wood hard		◇	♦
Exotic wood		◇	♦
Glulam			◇

♦ suitable ◇ partly suitable

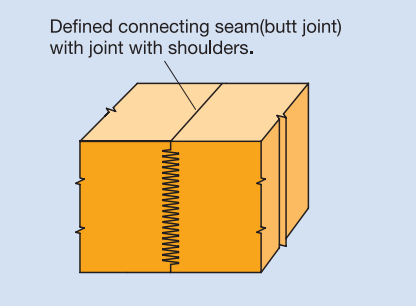

Joint types

Shoulder variations

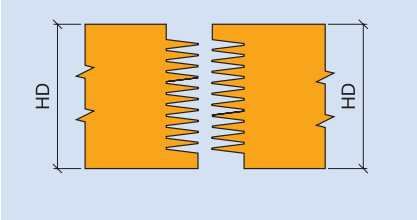

Strips with continuous joint present an irregular glue line on the side of the profile. To give a straight line (seam), the fingers are profiled with shoulder cutters. The number of fingers is determined by the wood thickness and the shoulder width.

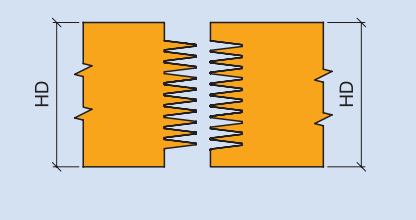

Continuous joint.

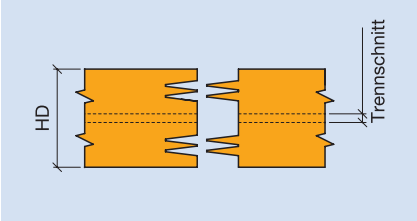

Joint with shoulders.

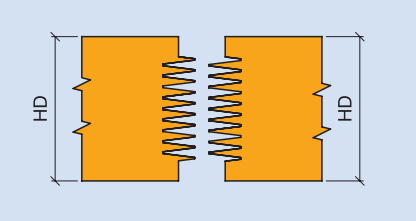

Profile 2: Staggered shoulders.

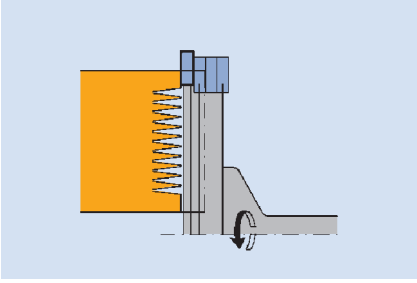

Profile 3: Level shoulders.

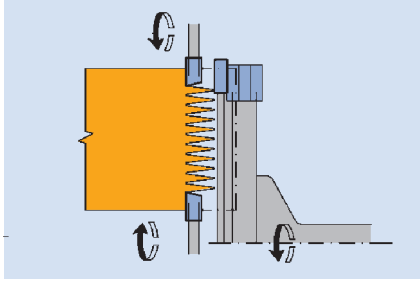

Profile 4: Shoulders for splitting.

Profile 5: Shoulder centralised.

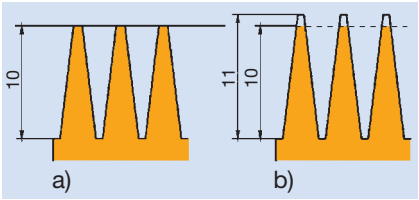

Hogger for trimming minifingers.

Hogger and scoring saw for trimming minifingers and scoring the butt joint.

The requirements for finger joints are defined in the standards DIN 68140 and EN 385 and EN 387.
Load group I (load-bearing components):
Multi-purpose finger joints for laminated panels BSH.
The components should be calculated according to DIN 1052. v ≤ 0.18.
Load group II:
Multi-purpose finger joints for construction timber (KVH).
Finger joints with shoulders also fall into this group. v ≤ 0.25.

Finger profiles

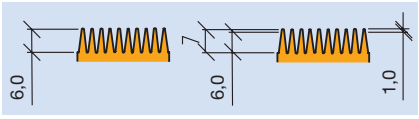

Minifinger profile
a – without cut-off, b – with cut-off

Finger length l mm	Finger pitch t mm	Width of finger tip b mm	Weakening degree v	Relativetip play s mm
10	3,8	0,60	0,16	0,30 – 0,50
15	3,8	0,42	0,11	0,45 – 0,75
20	5,0	0,50	0,10	0,60 – 1,00
20	6,2	1,00	0,16	0,60 – 1,00
30	6,2	0,60	0,10	0,90 – 1,50
50	12,0	2,00	0,17	1,50 – 2,50

Finger length 4 mm
Finger pitch 1.6 mm

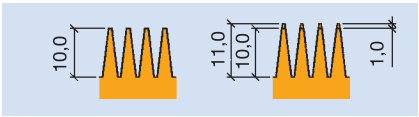

Production of mouldings, glued panels in furniture, mitre joints for windows/doors, picture frames.

Finger length 6/7 mm
Finger pitch 2.8 mm

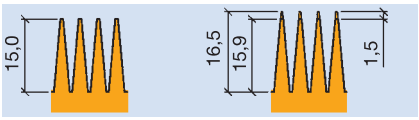

Wood finishing and residual wood for precise construction parts e.g. special window blanks, frieze strips, glued wood panels in furniture.
Reduced finger length to save wood. Tightly sealed finger profile feasible through the length determination of the fingers.

Finger length 10 mm
Finger pitch 3.8 mm

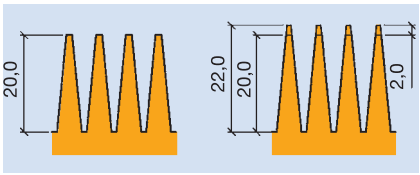

Wood finishing and wood residue recycling, lamellas for window blanks and glued panels in furniture. Finger length 10 mm to DIN 68140 (EN 385 and EN 387) for finger joints in coniferous wood for load bearing components. Finger joints present a visible tip play (S) after pressing.

Finger length 15 mm
Finger pitch 3.8 mm

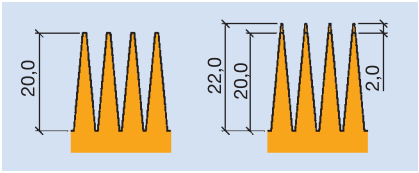

Wood finishing for BSH (laminated wood) and KVH (construction timber).
Finger joints in coniferous wood for high strength, load bearing components to DIN 68140 (EN 385 and EN 387), e.g. lamellas for laminated wood. These finger joints present a visible tip play (S) after pressing.

Finger length 20 mm
Finger pitch 6.2 mm

Wood finishing for laminated wood, mainly for construction timber, duo, trio and cross beams to DIN 68140, (EN 385 and EN 387) for finger joints in coniferous wood for high strength, load bearing components, e.g. lamellas for laminated wood.
These finger joint present a visible tip play (S) after pressing. Because of the greater pitch the finger seam is more visible and stability lower.

Finger length 20 mm
Finger pitch 5.0 mm

Wood finishing for laminated wood and KVH construction timber to DIN 68140 (EN 385 and 387) for finger joints in coniferous wood for high strength, load bearing components, e.g. lamellas for laminated wood, KVH, formwork beams. These finger joints show a visible gap after pressing.
Finger profile with higher stability than the fingers with 6.2 mm pitch. Advantage compared to ZL 15 mm: Because of greater pitch, the wood finger is more stable and easier to join together.

Minifinger joint cutter

Minifinger joint cutters with straight cut, straight back relief, staggered profile teeth, secured against twisting by design of tool body. Solid and robust cutter design with individually embedded tips.

Table for allowed RPM n = min^{-1} in relation to finger length ZL an diameter D.
Zero-diameter D_0 in relation to finger length for adjustment of the machine spindles.

ZL mm	D mm	D_0 mm	$n_{max.}$ min^{-1}
10	160	140	9,000
6	160	148	9,000
15	170	140	8,500
20	180	140	8,000
10	250	230	6,200
15	260	230	6,000
20	260	220	6,000

Application

For self-locking longitudinal joints for all kinds "in load bearing" components and window blanks with continuous finger joint.

Cutting material

HS, Marathon (MC) and HW.

Resharpening area

12 mm.

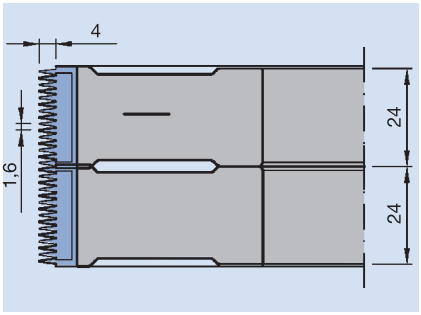

Feed rate

Depending on RPM up to 24 m min^{-1}.

High performance minifinger joint cutters, real Z 4

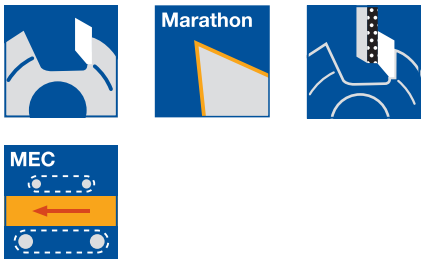

Application	For self-locking finger joints for supporting and load bearing components on high performance finger joint machines.
Machines	High performance finger joint machines with/without cut-off saw.
Workpiece material	Solid woods across grain.
Number of wings	Real Z 4.
Cutting material	HS and Marathon (MC).
Tool design	Solid steel tool body design with individually brazed finger knives. Higher number of wings for higher feed speeds and improved joint cut quality.
Feed	MEC.
Resharpening area	12 mm.
Particular benefit	A tool set, comprising of basic, top and bottom cutters for the required working width/height. The spiral knife arrangement reduces the power consumption and noise.

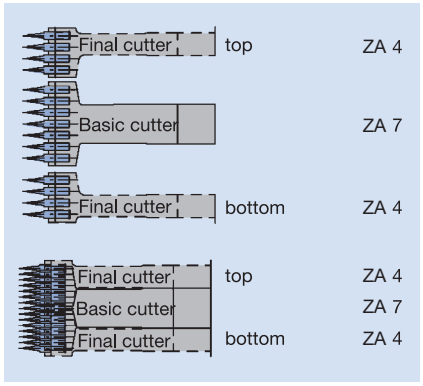

Minifinger joint cutter combinations with the finger lengths 10, 15 and 20 mm.

High performance minifinger joint cutters, real Z 6

Application	For self-locking finger joints for supporting and load bearing components for high performance finger joint machines.
Machines	High performance finger joint machines with/without cut-off saw.
Workpiece material	Solid woods across grain.
Number of wings	Real Z 6, for ZL 10 mm D = 250.
Cutting material	HS and Marathon (MC).
Tool design	Solid steel tool body with individually brazed finger knives. High number of wings for higher feed speeds and improved joint cut quality.
RPM	n_{max} = 6,000 min^{-1}.
Feed	MEC.
Resharpening area	12 mm.
Particular benefit	A tool set, comprising basic, top and bottom cutters for the required working width/height. The spiral knife arrangement reduces the power consumption and noise.

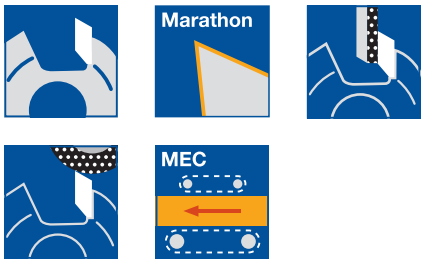

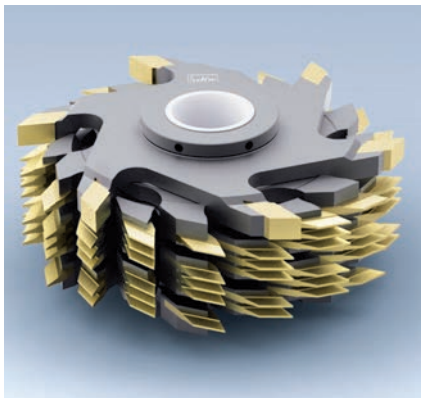

Combination for high performance minifinger joint cutter set Z 6.

Table to determining the number of minifinger joint cutters with finger pitch of 3.8 mm.

WM 620 2 01 Minifinger cutterhead

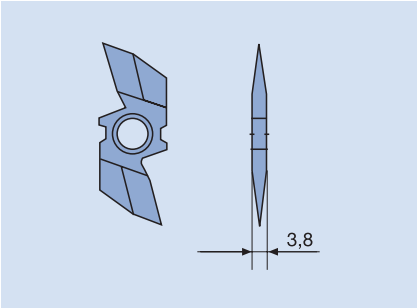

Minifinger cutterhead with resharpenable minifinger turnblade knives.
Wood thickness max. 60 mm adjustable with or without shoulders.
The resharpenable turnblade knives and the replaceable finger knives guarantee high flexibility and economic efficiency.
Knives are resharpened on standard multi-purpose sharpening machines with cooling.

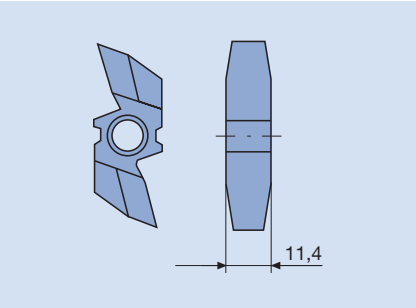

Application	For self-locking longitudinal joints for panel and moulding production with or without shoulders.
Machines	Double-end tenoners, double sided finger jointing lines with cut-off saw, single sided finger jointing lines with cut-off saw.
Cutting material	HW.
Resharpening area	2 x 6 mm.
Number of teeth/finger length	Z 6 or 3 + 3 at D = 250 mm , 10/11 mm finger length. Z 4 or 2 + 2 at D = 160 mm, 10/11 mm finger length.
Feed rate	Up to 36 m min^{-1}, depending on spindle RPM and cutting edge arrangement.

Note
For wood up to 60 mm thick: joints with/ without shoulders. Positioning the shoulder knives in 3.8 mm steps enables adjustment to different wood thicknesses.

Minifinger knife, 2 edges.

Shoulder knife, 2 edges.

Table to determination of required number of spare knives:

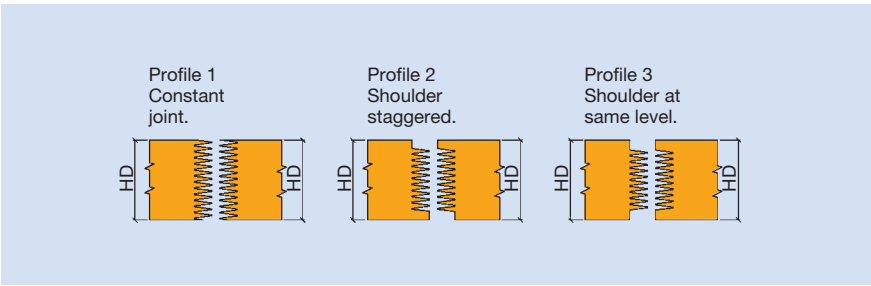

HD from-to mm	ZB mm	ZA	Half shoulder (HS) mm

Minifinger cutterhead Turbo Hawk

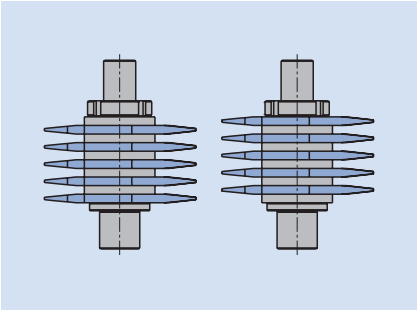

Resharpenable cutterhead system with individually replaceable HS circular knives. Production of different profiles with the same tool body. Flexible cutting edge arrangement with or without shoulders. Wood thickness to maximum 50 mm.

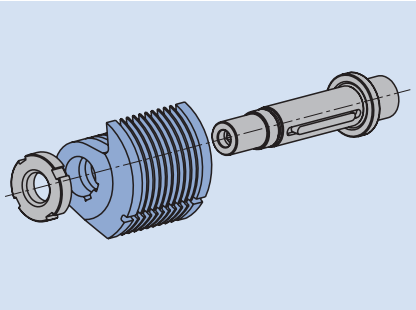

3.4 Finger jointing
3.4.3 Minifinger joint cutterheads

Application	For cutting self-locking longitudinal joints for exactly measured components, e.g. all kinds of finger joint profile moudlings, solid wood panels.
Machines	High performance finger jointing lines with cut-off saw.
Cutting material	HS, Marathon (MC).
Resharpening area	100 mm.
Number of teeth	Z 4 - Z 14
RPM	max. 6,000 min^{-1}
Advantages	Constant diameter tool system. Simple adjustment of knife sets with magnetic gauge. Flexible profile design for different timber thicknesses with or without shoulder knives. Consistent balancing quality by fixing the knives with keyway on the arbor. No contamination from grease due to closed hydraulic clamping system.
Note	Arbors can be fully equipped with knives or with gaps with spacers.

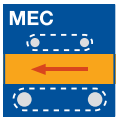

Arbor as change unit.
Knives mounted with spacer.

Knife mounting on the arbor.
Anti-twist keyway for the knives.

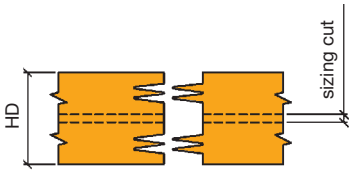

Profile 1 with continuous finger jointing

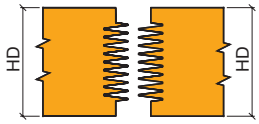

Profile 2 with staggered shoulder cutters

Profile 3 with shoulder cutters on the same level

Profile 4 with shoulder cutters for splitting

Profile 5 with half shoulder

Minifinger cutterhead with HW turnblade knives

Application:
For self-locking longitudinal joints for non-supporting components, e.g. panels and strips.

Machine:
Finger joint machines and continuous machines with cut-off saw.

Workpiece material:
Softwood and hardwood, across grain.

Technical information:
Steel tool body with HW turnblade knives. Particularly suitable for hardwood, e.g. for horizontal joints with and without shoulders. Variable design for defined wood thicknesses from 15 to 60 mm. The rest of the knife seating must be filled with spacers and a safety washer (spare part no. 4). Individual cutting edges can be replaced if a cutting edge breaks. Resharpening area 2 x 6 mm.

Profile 1 with continuous finger jointing

Profile 2 with staggered shoulder cutters

Profile 3 with shoulder cutters on the same level

Hydro minifinger cutterhead TurboHawk with curved knives

Application:
For self-locking longitudinal joints for non-supporting components.

Machine:
High performance finger joint machines and continuous machines with cut-off saw.

Workpiece material:
Softwood; limited suitability for hardwood.

Technical information:
Resharpenable, constant diameter and constant profile tool system with hydro clamping. No machine adjustment required. Particularly suitable for horizontal joints with and without shoulders. Variable for defined wood thicknesses from 15 to 50 mm. The remaining knife seatings must be filled with spacers and a locking nut. Minifinger curved knives with extremely large resharpening area.

WF 624 2
Disc cutter, minifinger profile with and without shoulders

Minifinger disc cutter tipped with HW or DP cutting edges. Variable arrangement for defined wood thicknesses, with or without shoulder cutter, mounted on screwed sleeve as tool set.

Application

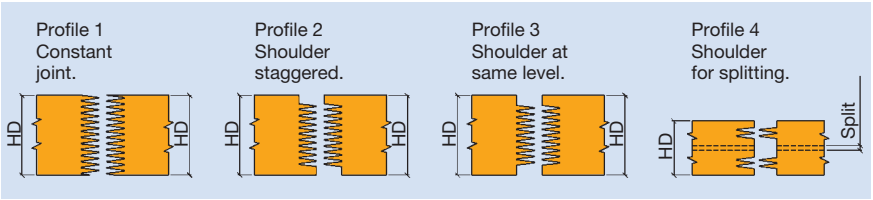

For self-locking longitudinal joints for precise measured components, e.g. finger joint solid wood panels, all kinds of mouldings, floors, parquet, stair and furniture parts, especially narrow mouldings.
Finger jointing lines with cut-off saw for high feed speeds.

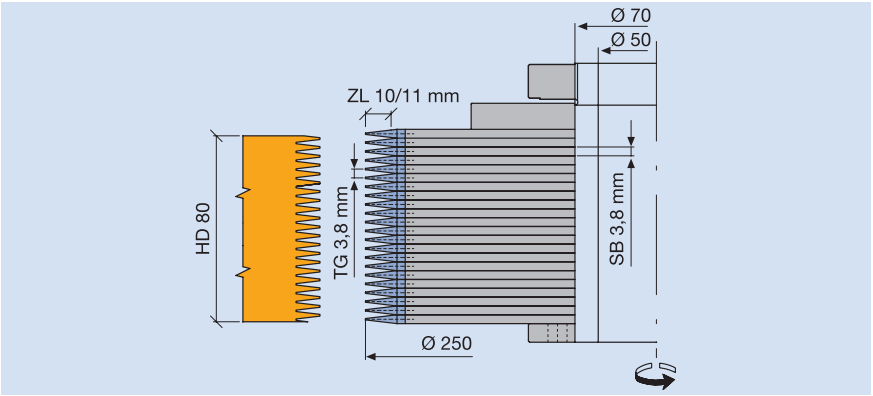

Cutting material

HW, DP.

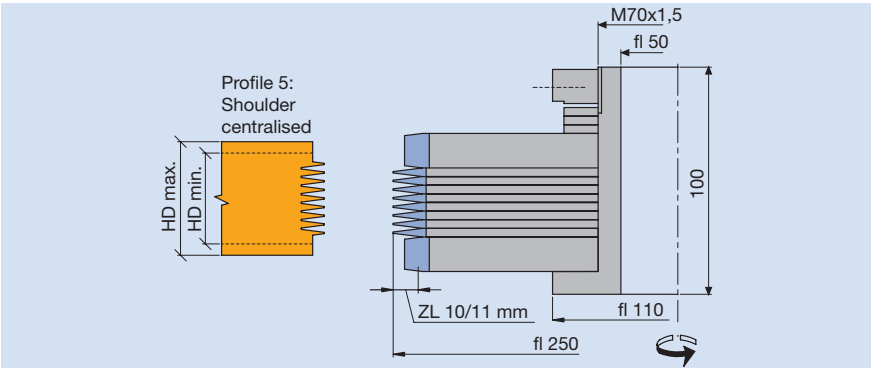

Resharpening area

HW = 3.5 mm, DP = 3-5 times resharpenable.

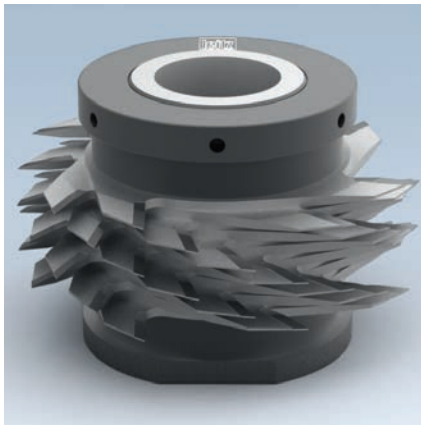

22 HW disc cutter for 80 mm wood thickness.

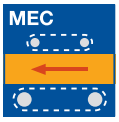

Minifinger shoulder cutter set with 8 finger.

Note:
DP minifinger disc cutters only suitable for knotless wood and wood derived materials that are planed at right angles. Exact clamping for vibration-free cutting is required.

HW

Minifinger disc cutter, HW, with and without shoulder cutter

Application:
For self-locking longitudinal joints for non-supporting components, e.g. panels and strips.

Machine:
Finger joint machines with cut-off saws.

Workpiece material:
Hardwood and abrasive tropical wood.

Technical information:
HW tipped cutters. Tool body thickness corresponds to finger pitch. Particularly suitable for horizontal joints with and without shoulders. Variable design for defined wood thicknesses from 15 to 80 mm. Suitable for small wood thicknesses. Resharpening area 3.5 mm. Design in DP on request.

Process step	Scoring across grain with feed.
Workpiece materials	Softwood and hardwood, wood derived material.
Cutting material	HW.
Machines	Finger jointing lines with scoring and cut-off saw.
Application	Scoring minifingers with shoulders.
Tool design **Scoring saw**	HW scoring sawblade, possibly double scoring sawblade mounted on flanged sleeve with bevel one side tooth shape.

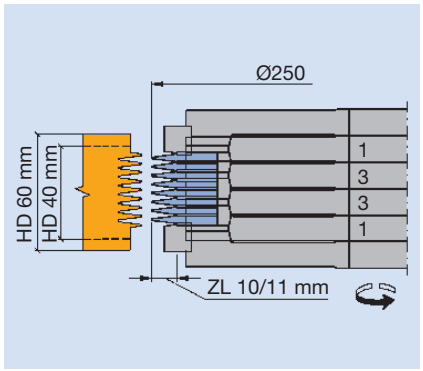

Double scorer scoring shoulders with minifinger joint cutters.

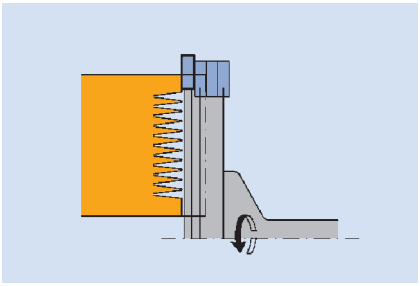

Advantage	Bevel one side teeth used with feed, for cleaner, tear-out free shoulders.

Hogger and scorer for trimming the minifinger joints and scoring the shoulder joint.

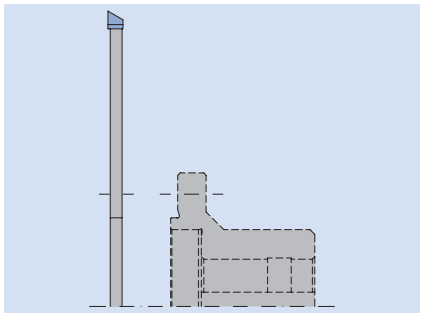

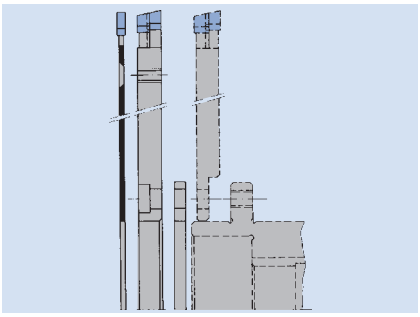

Hogger for trimming minifingers.

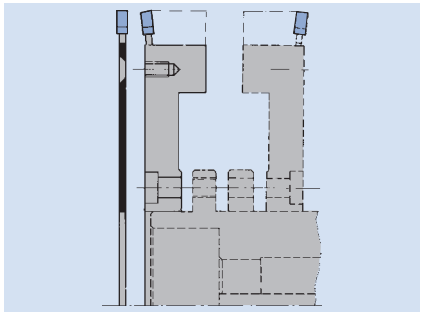

Process step	Hogging across grain.
Workpiece materials	Softwood and hardwood, wood derived material.
Cutting material	HW.
Machines	Finger jointing lines with cut-off saw.
Application	Trimming mini fingers.
Cutting width	Saw hogger: 6.35 mm and 8 mm. Hogger: 12 mm. Segment hogger: 10 – 25 mm.
Tool design	
Advantage	One side bevel HW teeth for clean, tear-out free end grain.

Saw hogger
HW circular sawblade mounted directly on flanged sleeve, bevel one side teeth.

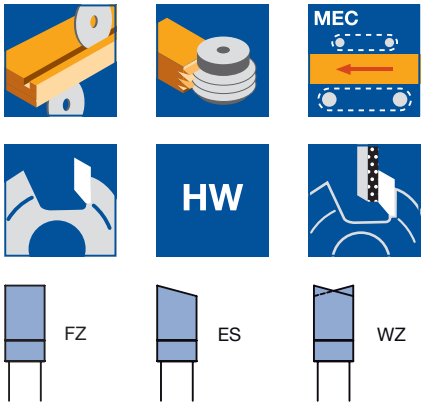

Saw hogger
HW circular sawblade with hogger discs mounted on flanged sleeve
(see section Panel Processing).

Segment hogger
HW circular sawblade with segmental tool body mounted on flanged sleeve
(see section Panel Processing).

Scorer for shoulder minifinger joints

Application:
For scoring in front of the trimming hogger or for machining the face edge of shoulder joints.

Machine:
Finger joint machines with trimming and scoring aggregates.

Workpiece material:
Softwood, hardwood and wood derived materials.

Technical information:
Particularly suitable for scoring the shoulders on finger joint machines. Tear-free shoulders guaranteed.

HW

Sawblade hogger for trimming minifingers

Application:
Defined trimming of the workpiece before cutting the fingers for adjusting the finger fitting.

Machine:
Finger joint machine with trimming aggregate, double-end profiler, tenoner.

Workpiece material:
Softwood, hardwood and wood derived materials.

Technical information:
HW circular sawblade with high number of teeth. Bevelled on one side for perfect cutting quality and reduced tear-outs.

Rebating cutterhead for joinery machines - HeliCut 15

Application:
For cutting grooves, rebate grooves, V-grooves as well as for jointing longitudinal and crosscut wood with large hogging depths in the wood construction.

Machine:
CNC-controlled joinery machines, as well as special machines for general wood construction with machine-specific adaptors.

Workpiece material:
Solid wood, preferably softwood for wood construction, hardwood (oak, ash etc.).

Technical information:
Carrier body constructed from high strength lightweight aluminium alloy. With 4-times turnable, spiral-shaped assembled HW turnblades. Application of the same knives as peripheral knives and spurs. The cutting bevels of the HW knives are numbered. No clamping wedges, direct tangential knife clamping. Easy handling of knife change without further mounting aid.

International window systems

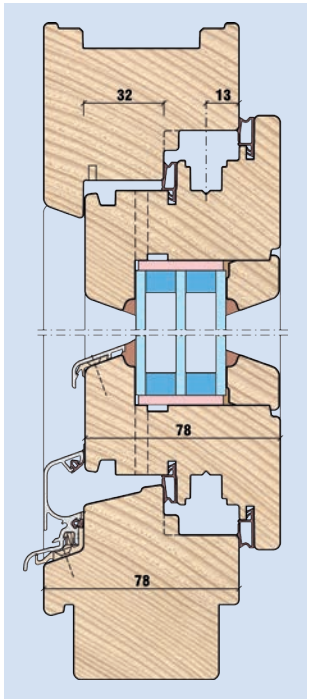

The window section is not just a matter of construction specification. More important are the national specifications to which a window must correspond for particular applications. EN 14351-1 defines these mandatory specifications. CE-marking clearly shows that a window meets all the required criteria of the intended application, defining the window construction. Leitz knows the business, and advises and supports customers on the correct design and the best tool.

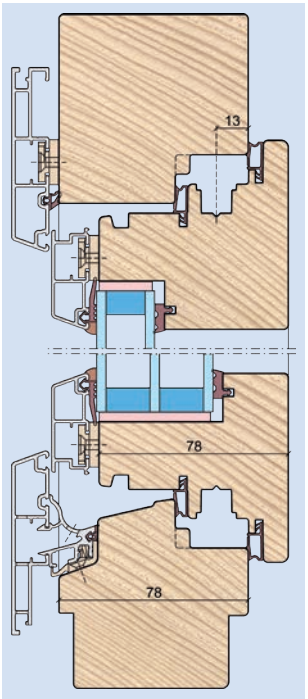

To support customers with CE certification, Leitz continental standard systems are listed on www.CE-fix.de (“Making CE marking easy for windows and external doors”) from VBH - the world's largest trading company supplying hardware for windows and doors.

In addition to window systems from Leitz, the patented RipTec technology for corner joints by Leitz, and the PlugTec corner joint, designed by Leitz and certified by the ift-Rosenheim Institute as per FE08-1, are also part of this platform.
All construction details in Leitz continental window systems have been designed as required by CE certification. Leitz’s national standard domestic window programs have successfully passed the system test at an authorized testing institute, such as ift-Rosenheim.

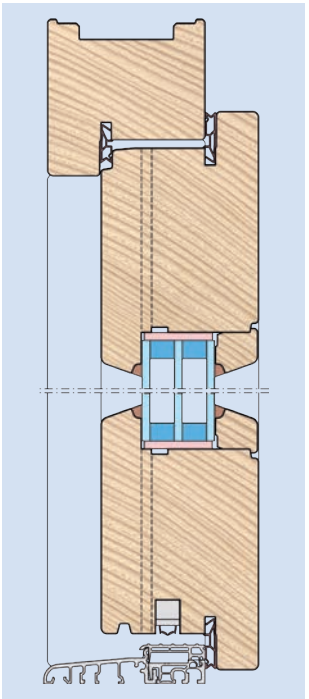

Leitz has specifically designed standard systems based on the requirements of certified window systems in order to meet country-specific requirements. These modular system solutions are characterized by high flexibility in production and design, and future-proof technical features including heat technology, noise protection and safety.

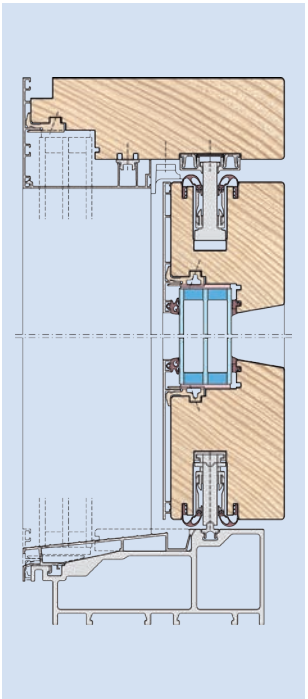

IV78 ClimaTrend
13 mm gear axle
32 mm distance of wind-rain block

IV78 ClimaTrend
13 mm gear axle

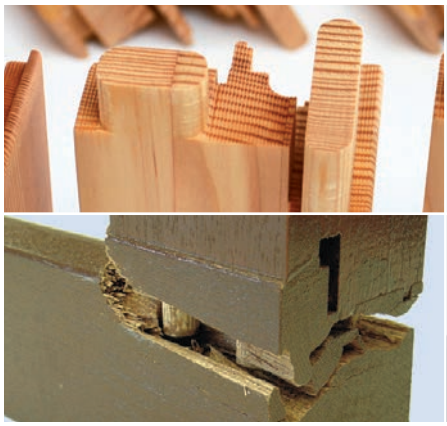

Front door, single rebate
Sash and frame sealing.
Rotary sash sealing stop and front door threshold for barrier-free installation.

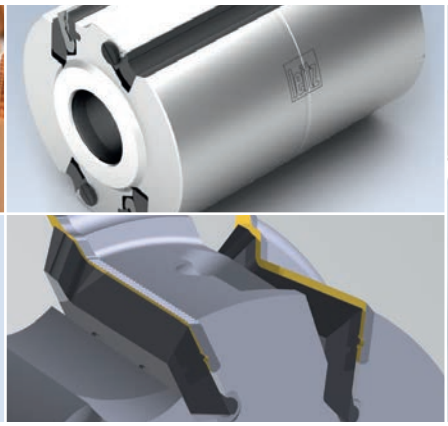

Wood/Alu sliding door
with fixed glazing in the frame
Ground-deep glazing with stepless exit.

Tool systems and processing technology

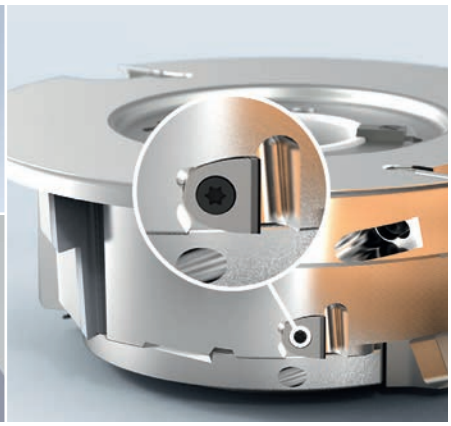

Especially for cutting technologies designed for the production of wooden windows, such as RipTec or Integral and Hybrid technology as well as toolsets of machine-specific features, allow optimal utilization of machine capacity with excellent machine quality at the same time.
The Leitz tool systems are described extensively in section Profile Tool Systems.

Leitz RipTec: Nearly tear-free finish and maximum stability of the joint with increased feed speed
Leitz PlugTec: The innovative corner joint for the most demanding applications

Leitz Integral: Precutting and finish processing with one single tool for increased performance time of the finish edge

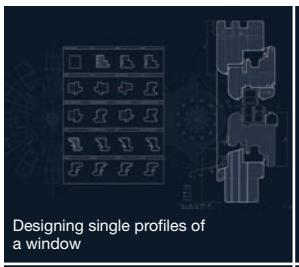

Leitz Hybrid: Combination of HW-tool systems with diamond edges for reduced edge wear

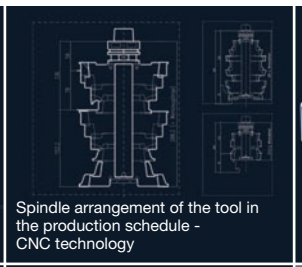

Engineering services

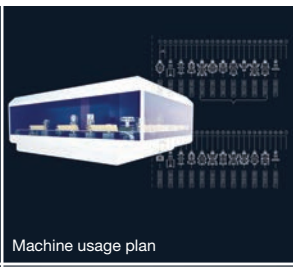

For a head start in an increasingly competitive international marketplace, right from the planning stage, you can count on Leitz. As your expert partner, we offer customized and efficient solutions for the production of modern window and door systems. After determining the requirements, Leitz work in cooperation with machine and software producers to ensure customers receive the most efficient service package. If maximum flexibility is required during production, then the toolsets are split. However, if productivity is the first priority then complete toolsets are the correct solution.
Leitz identify trends in the market, is in constant contact with notable international testing institutes, producers of hinges and seals, and understands what is important in window construction. Our window experts provide support in every way to carry out your objectives.

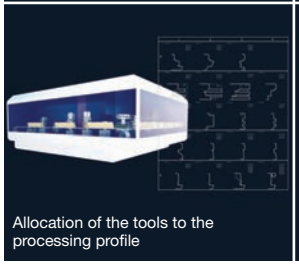

Designing single profiles of a window

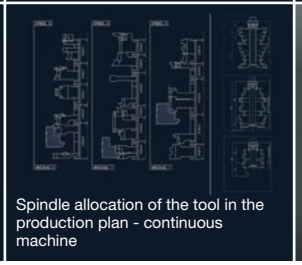

Spindle arrangement of the tool in the production schedule - CNC technology

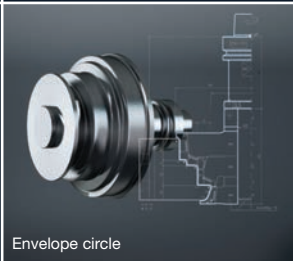

Machine usage plan

Allocation of the tools to the processing profile

Spindle allocation of the tool in the production plan - continuous machine

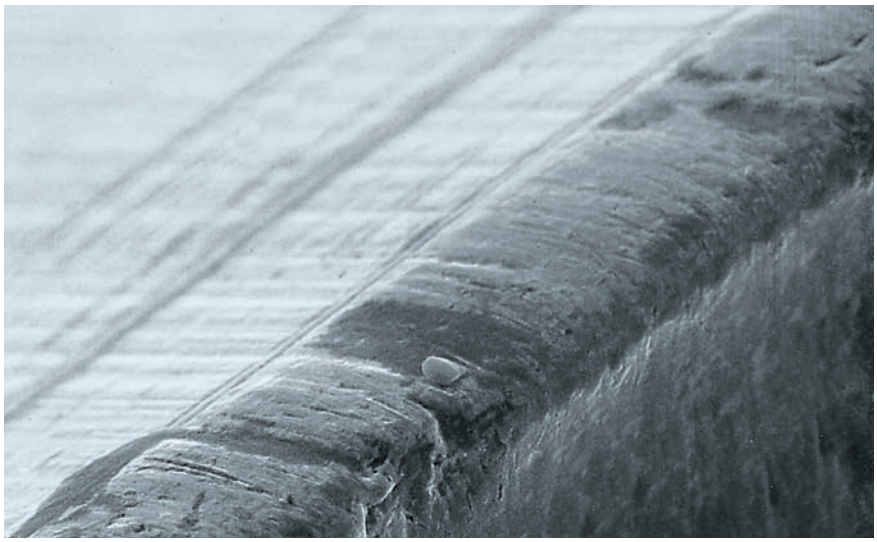

Envelope circle

Problem	Possible cause	Action
Surface defect Cutting quality	– RPM too low	Increase RPM and thus cutting speed increase tool diameter
	– Incorrect geometry	Measure, change tool
	– Spindle and tool tolerances too high	Check motor bearing and tolerances
	– Tool balance	Check and re-balance
	– Cutting speed too high (no chip formation), relation feed to number of teeth not adequate	Increase feed speed, Reduce number of teeth and RPM
	– Number of teeth too low, feed to high	Match number of teeth and feed speed
Wavy, rough surface	– Workpiece feed not consistent	Check feed speed and/or transport equipment
	– Infeed rollers with insufficient pressure or worn	Increase pressure of in feed rollers and recut serrations
	– Workpiece too thin or too short	Observe the machine manufacturer guidelines
	– Chip removal too high	Use for several working steps or pre relieve
	– Resin built up on tool, tool is blunt	Remove resin or resharpen
Surface defect Burn marks	– Cutting speed too high	Reduce cutting speed
	– Relation feed speed to number of teeth not adequate	Match number of teeth and feed speed
	– Tool continues to rotate in standing workpiece	Provide for continuous feed
Surface defect Tear-outs	– Wood moisture too low	Check drying control
	– Wood with many branches (loose branches)	Optimisation with crosscut saws and longitudinal joints
Surface defect Chip marks	– Angle geometry not matched to workpiece material	Check and adjust and/or new tool
	– Gap between knife and clamping element	Clean and carefully mount clamping element and knives
	– Gullet too small	Check and increase
	– Extraction hood and extraction not suitable	Contact machine manufacturer to clarify
	– Extraction performance insufficient in tool area	Guideline: 30 m s^{-1} air supply speed
Profile defect Workpiece – Angle error – uneven	– Tool set profiles not the same, e. g. sets with feed/against feed	Check and match tool sets
	– Stacked spindle positioned in feed direction or not at right angle to table	Check angle with clock gauge on vertically running spindle in two planes
	– Support table and fence worn out	Reprocess and/or replace support table and fence
	– Angle tolerance between support table and fence too big or fence and process edge not correctly adjusted	Check and adjust angles, align plane from fence to process edge including tool
Motor power Feed speed	– High resin build up on tool, tool blunt	Remove resin from tool and resharpen more frequently
	– Tool gullet too small	Check and increase
	– Cutting angle too small	Adjust or new tool
	– Cutting across grain too deep	Use several working steps or pre cut

Wear of HS cutting edges
When planing solid wood (softwood or hardwood) the HS cutting edges are subject to mechanical and chemical wear.
This leads to blunting of the cutting edges and will consequently affect the quality of the wood surface.

Significant blunting requires considerably more work when resharpening the knives and reduces the number of possible resharpens.

Wear of HS cutting edges.

Pitting wear at the face HS
Chemical wear can be very high because of the consistency of the wood, e.g. machining wet wood can lead to pitting of the face.

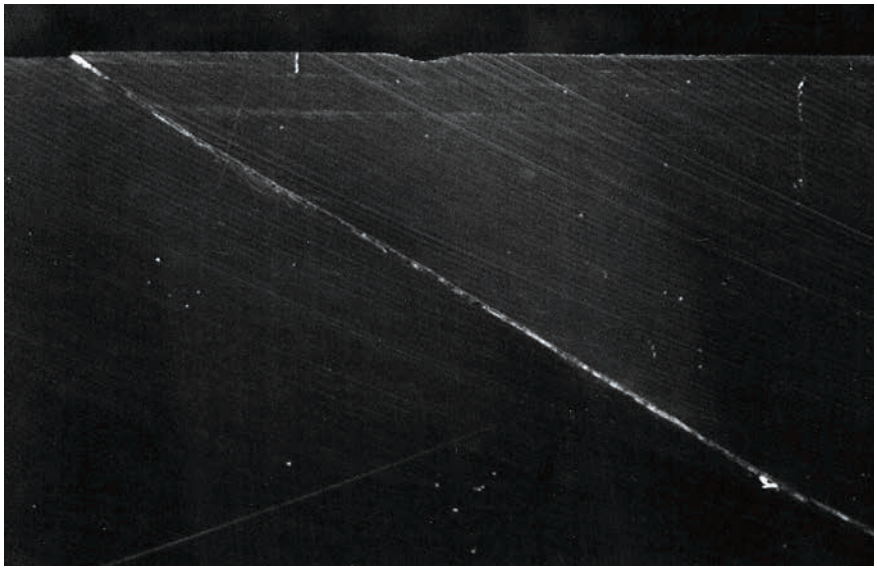

The pitting weakens the cutting edge and results in chipping/breakage.

Pitting wear.

Destruction of HW cutting edges
Too large knife projection or tipping material overhang will result in breakages when machining very hard wood.
Too large projection of carbide tipped planer knives, plus a low cutting angle can overstress the knife when machining very hard timber.
This can result in hairline cracks or knife breakages.

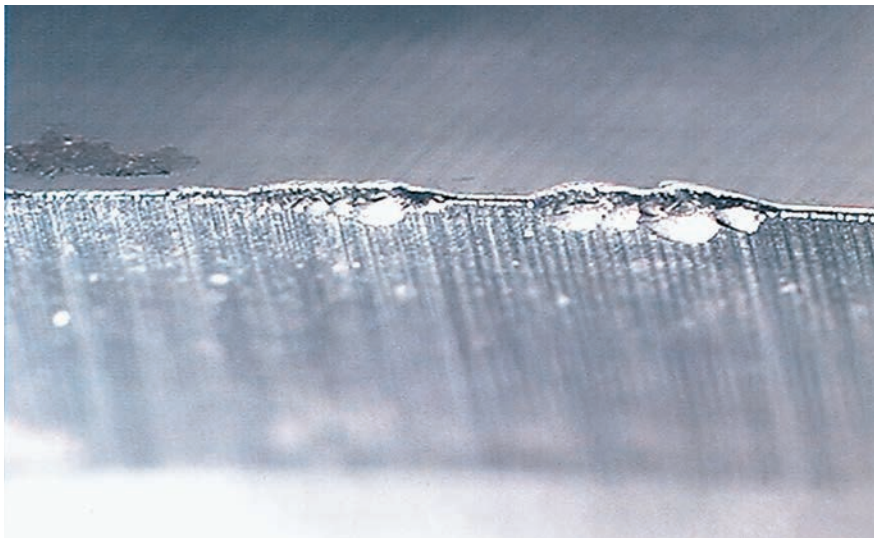

The maximum knife projection, angle geometry and minimum clamping length given in the handling instructions must be adhered to.

Destruction of HW cutting edges.

Cutting edge fractures
Dull cutting edges, unbalancing or weak feed pressure can create vibrations in the machine, especially when machining very hard materials.

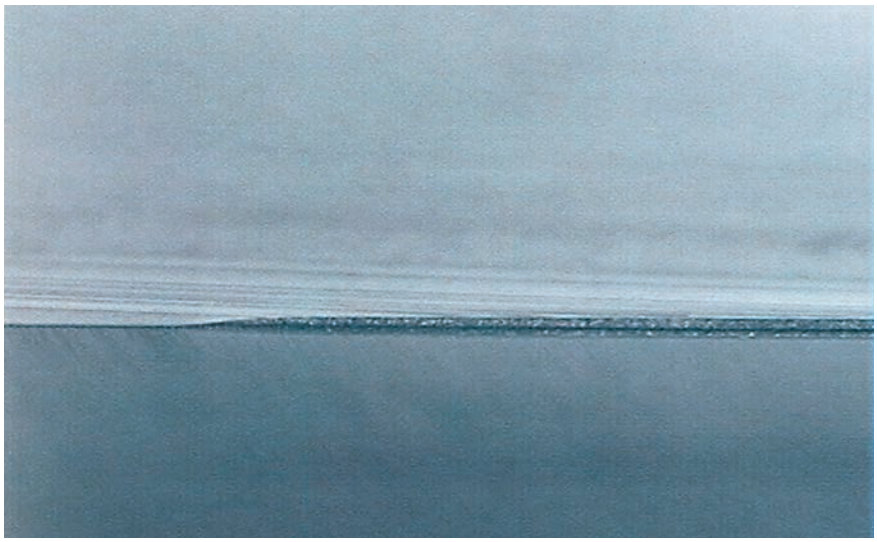

An uneven cutting force can result in chipping to the cutting edge. When tools are in constant use, it is important the tools are sharpened frequently and not allowed to become too blunt.
A higher cutting angle may help.

Cutting edge fractures.

Wear to HW cutting edges
The photograph shows the wear of a uniformly blunt cutting edge.

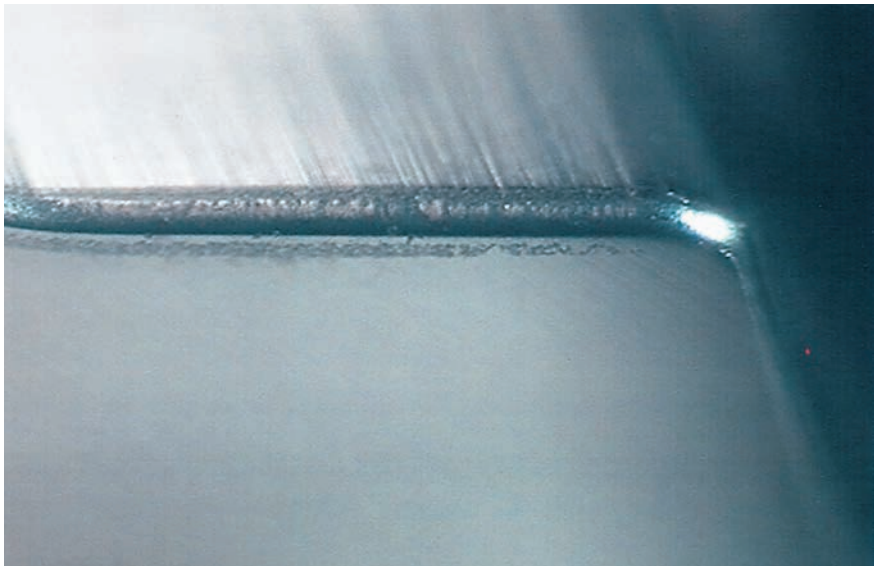

The cutting edge can be resharpened without a significant material loss.
This increases the overall performance time of the tool.

Wear of HW cutting edges.

Too much wear to cutting edges
When the cutting edges are very blunt, the cutting force becomes too high, the surface quality deteriorates, resulting in additional resharpening and loss of tool life.

If the cutting edge is not resharpened correctly, the performance time is reduced, resulting in cutting edge fractures.

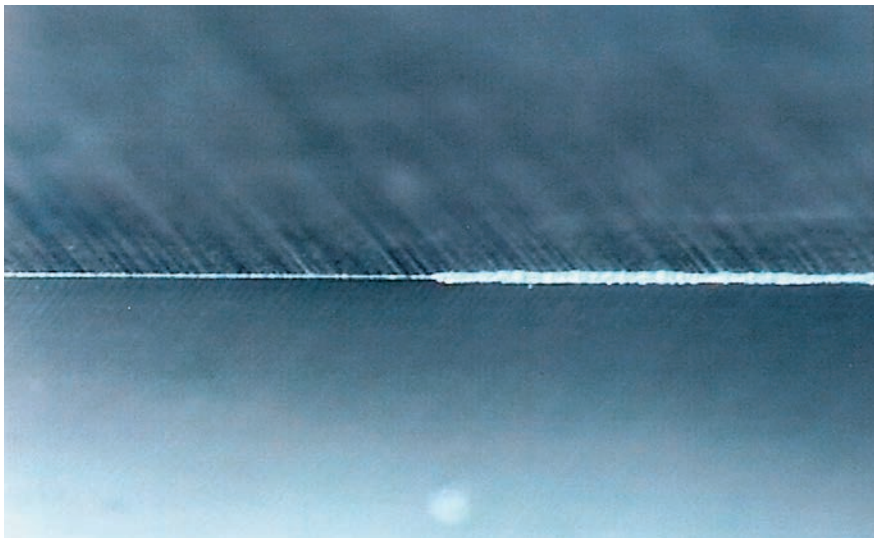

Too much wear on cutting edges.

Cutting edge abrasion
For largely homogenised materials, mechanical wear will lead to continuous rounding of the cutting edges.

The quality of the surface determined the level of abrasion and should normally be, as a guideline, between 0.2 to 0.3 mm maximum.

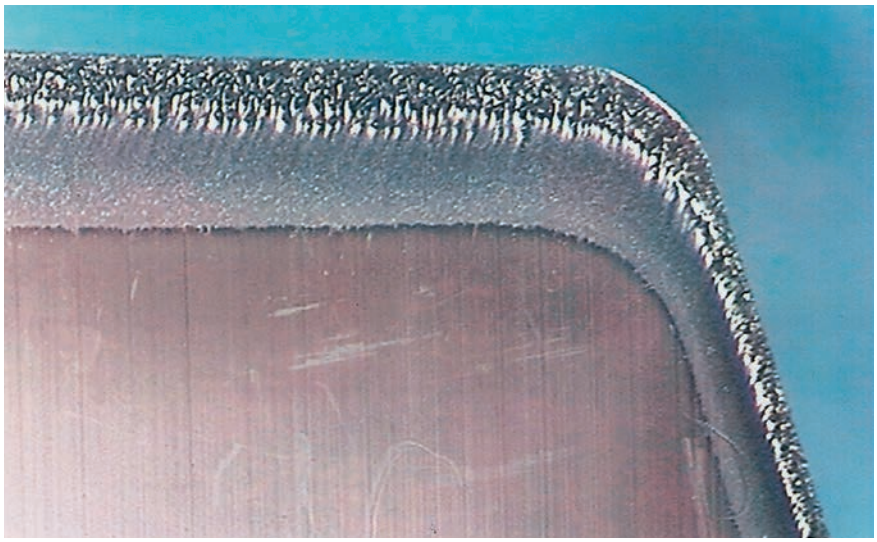

Tipped tools require resharpening to ensure the efficiency of the tools.

Common rounding of cutting edges after use for spruce

Cutting edge abrasion by chemical impact
When processing workpiece materials with a high content of tannic acids (e.g. oak), the cutting edge abrasion is mainly caused by mechanical plus chemical wear.

Cobalt, a binding agent in tungsten carbide, is washed out by chemical reaction leading to early depletion of the cutting edge.

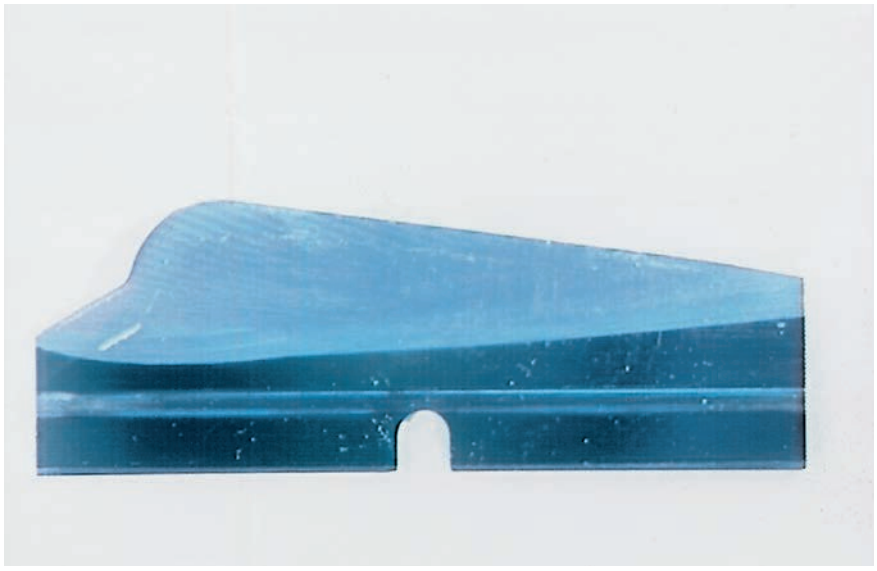

Chemical impact – Cutting edge abrasion – Application oak

Cutting edge damage caused by improper repair
For cutterheads/sets with HW cutting elements, the knives must be turned or replaced after reaching the end of their performance time.

Resharpening parallel to face will reduce the essential clamping forces, creating gaps between knives and clamping wedges, impair the surface quality, and is not permitted for safety reasons.

Ensure careful cleaning and mounting when changing the knives of tools with turnblade/throw away knives.

Cutting edge abrasion caused by improper repair

Enquiry/order form special tools – planing and profiling

Technical information:

Tipped tools (bevel trimming cutters/profile routers):
Design: bending test, Z2, mech. feed, Z3, Z4, round shape
Tooth shape: with/without spur

Table for min. tool diameter.
Applicable for bevel trimming cutter
BO – 30 mm:
For bore 40 mm:
D + 10 mm
For bore 50 mm:
D + 20 mm

Formula for min. tool diameter:
Applicable for profile routers BO – 30 mm:
For bore 40 mm: D + 10 mm
For bore 50 mm: D + 20 mm
Formula: D_{min} = 100 + 2 x PT (mm)

Note:
Bevels of more than 45° and large profile depths require large diameters. The maximum permitted RPM must be considered when calculated the cutting diameter and must not be exceeded. Profile sketches must clearly indicate whether the material (wood) or cutter is shown. Please specify motor side, direction of rotation, dimensions and any other conditions on the material sample or the drawings.

Assembled tools with turnblade/throw away knives:
Formula: D_{min} = 90 + 2 x PT (mm) – Applicable for BO – 30 mm

Sketch for application plan, profile drawing, special motor spindle etc.
Please specify workpiece support and fence side and/or workpiece face side top/bottom.

Explanation of abbreviations

A	=	dimension A
a_e	=	cutting thickness (radial)
a_p	=	cutting depth (axial)
ABM	=	dimension
APL	=	panel raising length
APT	=	panel raising depth
AL	=	working length
AM	=	number of knives
AS	=	anti sound (low noise design)
b	=	overhang
B	=	width
BDD	=	thickness of shoulder
BEM	=	note
BEZ	=	description
BH	=	tipping height
BO	=	bore diameter
CNC	=	Computerized Numerical Control
d	=	diameter
D	=	cutting circle diameter
D0	=	zero diameter
DA	=	outside Diameter
DB	=	diameter of shoulder
DFC	=	Dust Flow Control (optimised chip clearance)
DGL	=	number of links
DIK	=	thickness
DKN	=	double keyway
DP	=	polycrystalline diamond
DRI	=	rotation
FAB	=	width of rebate
FAT	=	depth of rebate
FAW	=	bevel angle
FLD	=	flange diameter
f_z	=	tooth feed
$f_{z\ eff}$	=	effective tooth feed
GEW	=	thread
GL	=	total length
GS	=	Plunging edge
H	=	height
HC	=	tungsten carbide, coated
HD	=	wood thickness (thickness of workpiece)
HL	=	high-alloyed tool steel
HS	=	high-speed steel (HSS)
HW	=	tungsten carbide (TCT)
ID	=	ident number
IV	=	insulation glazing
KBZ	=	abbreviation
KLH	=	clamping height
KM	=	edge breaker
KN	=	single keyway
KNL	=	combination pinhole consists of 2/7/42 2/9/46,35 2/10/60
L	=	length
l	=	clamping length
LD	=	left hand twist
LEN	=	Leitz standard profiles
LH	=	left hand rotation
M	=	metric thread
MBM	=	minimum order quantity
MC	=	multi-purpose steel, coated
MD	=	thickness of knife
min^{-1}	=	revolutions per minute (RPM)
MK	=	morse taper
m min^{-1}	=	metres per minute
m s^{-1}	=	metres per second
n	=	RPM
$n_{max.}$	=	maximum permissible RPM
NAL	=	position of hub
ND	=	thickness of hub
NH	=	zero height
NL	=	cutting length
NLA	=	pinhole dimensions
NT	=	grooving depth
P	=	profile
POS	=	cutter position
PT	=	profile depth
PG	=	profile group
QAL	=	cutting material quality
R	=	radius
RD	=	right hand twist
RH	=	right hand rotation
RP	=	radius of cutter
S	=	shank dimension
SB	=	cutting width
SET	=	set
SLB	=	slotting width
SLL	=	slotting length
SLT	=	slotting depth
SP	=	tool steel
ST	=	Cobalt-basis cast alloys, e.g. Stellite™
STO	=	shank tolerance
SW	=	cutting angle
TD	=	diameter of tool body
TDI	=	thickness of tool
TG	=	pitch
TK	=	reference diameter
UT	=	cutting edges with irregular pitch
V	=	number of spurs
v_c	=	cutting speed
v_f	=	feed speed
VE	=	packing unit
VSB	=	adjustment range
WSS	=	workpiece material
Z	=	number of teeth
ZA	=	number of fingers
ZF	=	tooth shape (cutting edge shape)
ZL	=	finger length

Notes to the Lexicon concerning the diagrams and tables

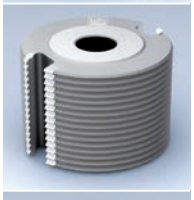

The statements made in the diagrams and tables relate to specific conditions and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

Enquiry/order form special tools – manual feed		66
Alphabetical product index		68
ID index		69

Application

To produce different groove widths, manual or mechanical feed, along or across the grain.

Workpiece material

Softwood and hardwood, glulam, chipboard and fibre materials, uncoated, veneered, plastic and paper coated. Plastics and foams.

Machines

Portable machines, spindle moulders, moulders, double-end tenoners, machining centres, edgebanding machines etc.

Type of feed

Manual feed:
Application only against feed.

Mechanical feed:
Application with or against feed,
for minimum tear out, use with feed necessary.

Tool design

Tipped tools:
With HW or DP. DP tips suitable for abrasive materials.

Replaceable tip tools:
Design with HW turnblade cutters for constant diameter and constant cutting widths.

Two and multiple part tools:
Designed so the cutting width can be adjusted either by spacers (adjustment steps of 0.10 mm) or by a continuously adjustable sleeve for HW or DP tipped tools.

Single tools:
Suitable for use as set.

Optimised gullet design DFC:
The DFC concept directs the chips away from the workpiece, so leaving the tool cutting area unhindered. DFC increases tool performance.

Benefits:
– Better product quality by eliminating chip marks or damage to the workpiece edges.
– Reduced tool cutting edge wear by eliminating multiple cutting.

Recommended value for tooth feed rate f_z (in mm)

Solid wood	
Along	0.60 – 0.80 mm
Across	0.30 – 0.40 mm
Glulam	0.40 – 0.50 mm
Chipboard and fibre material	
Without coating	0.50 – 0.70 mm
Coated	0.20 – 0.40 mm
Veneered	0.10 – 0.15 mm
Wood derived materials	
Middle layer	0.30 – 0.60 mm
Top layer	0.08 – 0.12 mm
Plastic	0.20 – 0.50 mm
Polymer compound	0.05 – 0.05 mm
Non-ferrous metals	0.03 – 0.05 mm

$v_f = f_z \cdot n \cdot Z/1000$

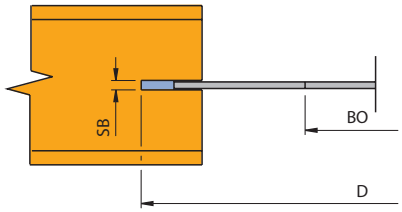

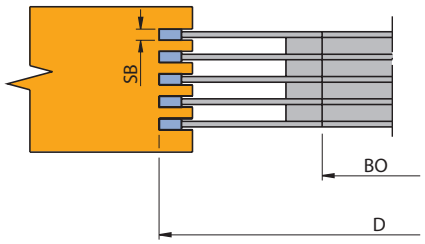

Scheme: Grooving in middle layer

Scheme: Set assembly for lock corner joint

Grooving cutters for manual feed

Application:
For grooving with (MEC) or against feed (MAN).

Machine:
Spindle moulders, moulders and double-end tenoners.

Workpiece material:
Solid wood; uncoated, coated and veneered wood derived materials.

Technical information:
Tool body design with round, closed shape.

HW

Profile cutter - pitch pockets

Application:
Optimized for milling pitch pockets.

Machine:
Portable machine Lamello Standard and Lamello Top.

Workpiece material:
Softwood and hardwood.

Technical information:
Two reciprocal cutting knives.

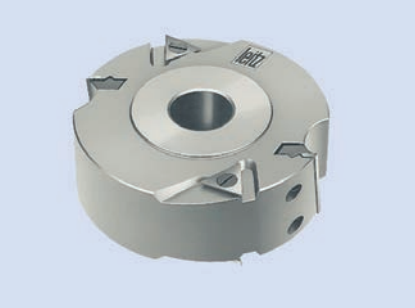

Radii profile
WF 502 1

D mm	SB mm	BO mm	BEM	Z	ID
100	8	22	Size 1-3	1+1	**020126** ●

RPM: n = 7700 - 13000 min^{-1}

Type of operation	Rebate tools cut on the periphery and the side. The rebated edge is produced by spurs.
Workpiece material	Softwood and hardwood, glulam, chipboard and fibre materials, uncoated, veneered, plastic and paper coated. Plastics and foams.
Machines	Spindle moulders. Edgebanding machines; double-end tenoners. Four-sided moulders.
Application	Jointing and rebating against feed: all panel materials with or without coating. Jointing and rebating with feed: machining solid wood with heavily twisted fibres and risk of tear outs. Only for machines with mechanical feed. Note: Difficult chip removal. Jump cutting: jointing with or against feed across grain to avoid tear outs at the front and rear workpiece edges after edgebanding or lipping.

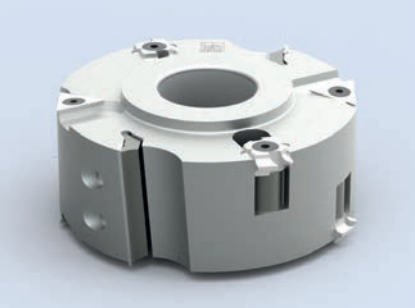

Tool design

Turnblade rebating cutterhead with alternate shear angle:
Reduced feed and cutting forces achieve clean and tear out free rebating edges. Suitable for all coated and uncoated panel materials as well as solid wood.

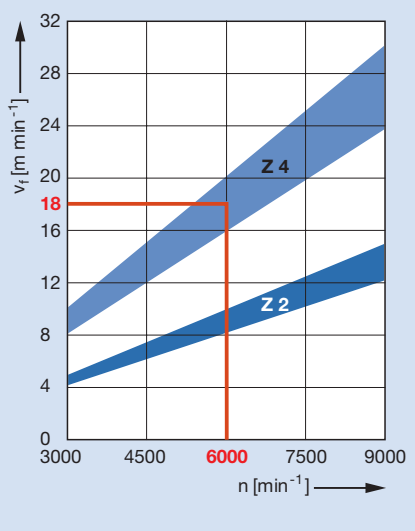

2 part tools with alternate shear angle:
Can also be used as adjustable grooving tools.

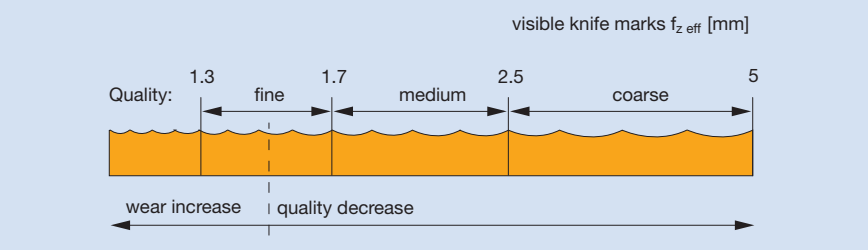

Turnblade rebating cutterhead with additional knives (edge knives):
Multi-purpose tool for jointing, rebating and rounding/bevelling.

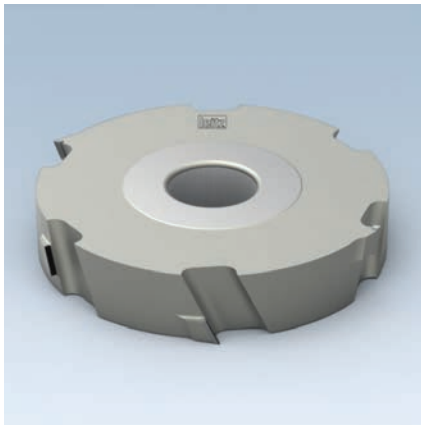

Feed speed depending on RPM and no. of teeth

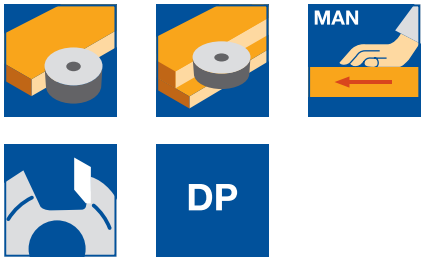

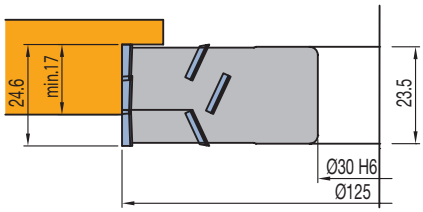

Relation between surface quality and length of knife marks $f_{z\,eff}$

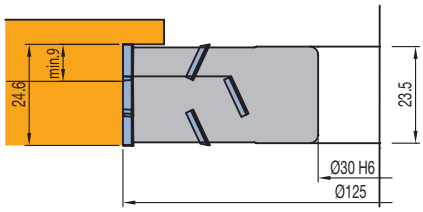

With multi blade tools, only the marks of one knife show on the surface (one knife finish).
Z 2 and Z 4 tools produce the same surface quality with the same machine setting.
High numbers of teeth are required for a high hogging performance.

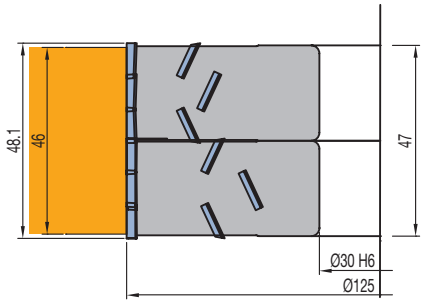

Jointing cutter ID **090853**
Rebate height min. 17 mm

Jointing cutter ID **090872**
Rebating height min. 9 mm

Set existing of ID **090853 and** ID **090872**

Jointing and rebating cutter Diamaster PRO

Application:
Optimized for rebating and jointing with and against feed (e.g. jump cutting). Manual feed only against feed.

Machine:
Spindle moulders and edgebanding machines, double-end tenoners.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.) uncoated, laminated veneer lumber (plywood etc.), plastomers, solid surface material (Corian, Varicor etc.) fibre reinforced plastics (GFRP, CFRP etc.).

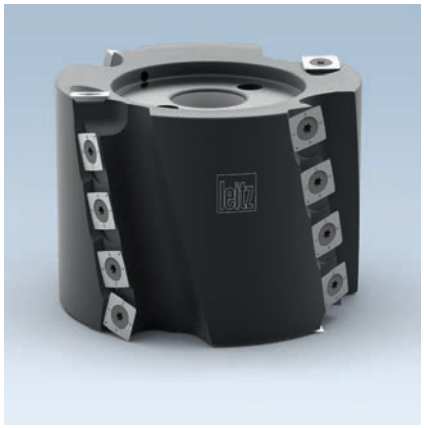

Technical information:
Composite tool with alternate shear angle and main blades with pre-cutting function. Long performance times through polished cutting area. Diamaster PRO design for two resharpening cycles with standard wear. Double sided rebating possible. For larger cutting widths a stacking of various tools is possible. 3.5 mm tipping height. 1.5 mm resharpening area.

Feed speed v_f depending on the number of teeth Z and speed n for solid wood (pre trimming and copy shaping)
Example for tool diameter 125 mm:
n = 9000 min^{-1}
Z 2
Application: copy shaping along the grain
v_f = 12 m min^{-1}

Copy shaping cutterhead - HeliCut 15

Application:
For pre-cutting, jointing and copy shaping of large cutting depths. For copy shaping of curved workpieces with template, ball bearing and guide ring.

Machine:
Spindle moulders and profile milling machines, double-end tenoner, stationary routers with and without CNC control.

Workpiece material:
Softwood and hardwood, glulam, chipboard and fibre materials (MDF etc.) uncoated, plastic coated, veneered etc.

Technical information:
Noise reduced design with staggered edges and very deep gullets for improved chip removal. Tungsten carbide cutting edges with Microfinish for perfect surface quality. Rebate tools cut on the periphery and the side.

Diamaster WhisperCut EdgeExpert jointing and rebating cutterhead

Jointing and rebating cutterhead WhisperCut EdgeExpert

Application:
Optimized for noise reduced rebating and jointing particularly for sensitive decorative papers, foil coatings and veneers.

Machine:
Spindle moulders and edgebanding machines.

Workpiece material:
Chip and fibre boards (MDF etc.) raw, veneered, painted and coated; especially for plastic, paper, HPL and anti-fingerprint coatings. Also suitable for surfaces in mat, high gloss or with relief structures.

Technical information:
DP tipped cutterhead with alternate shear angle for tear-free jointing edges and cutting surface. With rebating knife for tear-free rebating edges (up to 11 mm rebating width). Increased shear angle for excellent edge quality on sensitive decorative papers, foil coatings and veneers. Noise reduced design with up to 5 dB(A) noise reduction. Significant weight reduction by using an aluminium alloy tool body. Carrier body for multiple use with exchangeable knives. 0.6 mm resharpening area.

Bevelling from above

Bevelling from below

Bevel cutterhead turnblade, swivelling

Application:
For jointing and bevelling with adjustable bevel angle.

Machine:
Spindle moulders, moulders, edgebanding machines, double-end tenoners and special machines.

Workpiece material:
Softwood and hardwood, laminated veneer lumber, plastomers, limited suitable for MDF and chipboad (uncoated or coated).

Technical information:
Knife holder swivelling adjustable from 0 - 90°. Quick and easy angle adjustment of common angles (15°, 30°, 45°, 60°) by additional locking positions in 15° steps. Free of marks cutting result due to 1-part, continuous cutting edge. Economical due to changeable tungsten carbide turnblades with two cutting edges. Optimized gullet design for improved chip removal.

Turnblade, adjustable bevel angle

Bevelling from above

Bevelling from below

Bevel cutterhead HeliCut, swivelling

Application:
For jointing and bevelling with adjustable bevel angle.

Machine:
Spindle moulders, moulders, edgebanding machines and double-end tenoners.

Workpiece material:
Softwood and hardwood, laminated veneer lumber, plastomers, technical foams (XPS, PU), limited suitable for MDF and chipboard (uncoated or coated).

Technical information:
Knife holder can be swivelled steplessly on both sides from 0 - 65°. Quick and easy adjustment of conventional angles (15°, 30°, 45°, 60°) due to additional locking positions in 15° steps. Design with divided cutting edges and optimized gullet areas for low-noise working with low cutting pressure even at high cutting performance. Workpiece edges free of tear-out on both sides even in critical materials due to alternating tool angle. Cutting edges with particularly precise geometry and polishing for long tool life and machining of „soft“ materials. Economical due to partially exchangeable solid carbide blades with 4 cutting chamfers.

Types of operation	The tools in the following section are suitable for producing glue joints, divided into glue joints (along the grain) and mitre joints.
	Glue joints along grain Glue joint profiles for length grain glue joints have a low profile depth to minimise the material loss at each glue joint. Glue joint profiles do not increase the stability of the glue joint. The profile is used to position the wood precisely, so it does not slip during pressing. Length grain glue joint profiles are not self-locking. The workpieces must remain pressed together until the glue has hardened completely. Profile tools for glue joints along the grain are not suitable for mitre joints.
Workpiece material	Softwood and hardwood.
Machine	Spindle moulders with or without power feed. Four-sided moulders. Double-end tenoners.
Application	Against the feed, always along the grain.
	Mitre joint Solid wood and wood-derived materials cannot be glued on the end faces side without glue joint profiles. Compared to glue joints along the grain, mitre glue joint profiles increase the stability of the joint. These profiles have a greater profile depth, generally 10 mm. Mitre joint profiles must have a straight edge area to create a defined straight joint in the visible area. The profiles are slightly self-locking. This means the workpieces needs to be pressed together briefly and can only be machined after the glue has hardened. Mitre joints are typically used to produce segments for arched windows or profiled mouldings.
Workpiece material	Softwood and hardwood.
Machine	Spindle moulders with clamping device and sliding table. Double-end tenoners. Window machines. Stationary routers with or without CNC control.
Application	Against feed, across or along the grain.

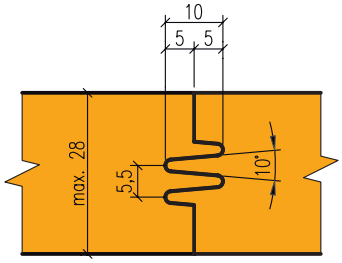

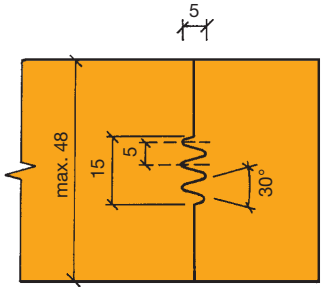

Mitre joint/longitudinal glue joint profile

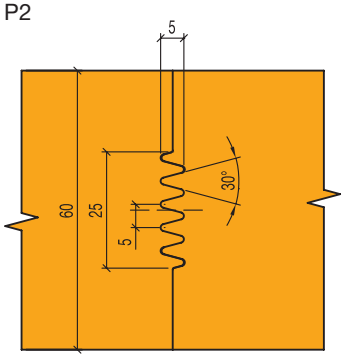

P1

Width glue joint profile

P2

P3

Profile cutterhead ProfilCut Q for glue joint profiles

Application:
To cut glue joint profiles with high fit accuracy. Profile P2-4 for processing with the grain for precise positioning of the wood to be glued. Profile 1 is especially suitable for mitre joint profile/longitudinal glue joint profile and for frames.

Machine:
Spindle moulders and moulders.

Workpiece material:
Softwood and hardwood.

Technical information:
Finger profile in rounded design (softline). Effective wood use through small profile depth.

Adjustment scheme

Profile example

Profile cutterhead ProfilCut Q for glue joints along the grain and mitre joints

Application:
For glue joint profiles along grain with precise positioning. Exact positioning of the wood to be glued together and for producing corner joints.

Machine:
Spindle moulders and moulders.

Workpiece material:
Softwood and hardwood, veneered panel materials.

Technical information:
Wood thickness 15 to 48 mm; basic clearance 0.3 mm, side clearance 0.1 mm. Economic wood use due to small profile depth.

Profile depth 6.4 mm

Type of operation

Profiling in craft and industry. As there are many different applications, the features of the tool and the wood types to be processed are described in the respective product pages.

Feed speeds depending on RPM, length of knife marks and number of teeth

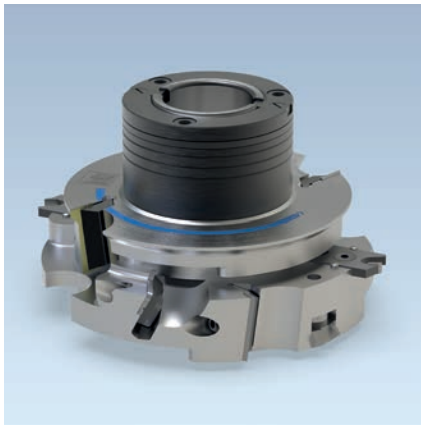

Relation between surface quality and length of knife marks $f_{z\ eff}$

With multi blade tools, only the marks of one knife show on the surface (one knife finish).
Z 2 and Z 4 tools produce the same surface quality with the same machine setting.
High numbers of teeth are required for a high hogging performance.

Workpiece material
Machines
Application

Please refer to the relevant product pages, depending on the operation and profile.

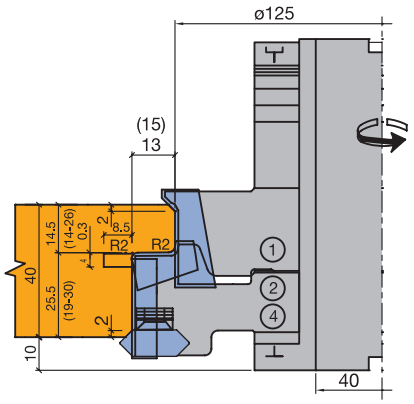

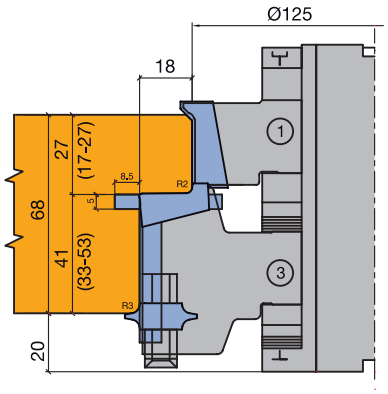

Turnblade ProfilCut Q profile cutterhead set for internal door production

Application:
For external door profiles with single rebate, rebating depth 13/15/18 mm. Extendable for double rebate 12/15 and 15/15.

Machine:
Spindle moulders and moulders.

Workpiece material:
Softwood and hardwood.

Technical information:
Combinable for front door, single and double rebate. Double rebate profiles by using additional tools. Tool body of aluminium. ProfilCut jointing cutterhead with chamfers to edges, rebate cutterhead with turnblade knives, spurs and seatings for edge knives and seal groove knives.

Radii profile cutterhead

Profile cutterhead ProfilCut Q

Application:
For different radii profiles with different profile knives. Copy shaping of curved workpieces using template and ball bearing guide ring.

Machine:
Spindle moulders and moulders.

Workpiece material:
Softwood and hardwood.

Technical information:
Production of counter profile possible by combining with the fluting profile. Tool can be used on both sides as panel raising cutter (straight panel raising).

Profile cutterhead D-140(144) mm

Left = 1 working step
Right = 2 working steps

Profile cutterhead set ProfilCut Q - radii profile

Application:
For different radii profiles with different profile knives. Copy shaping of curved workpieces using template and ball bearing guide ring.

Machine:
Spindle moulders and moulders.

Workpiece material:
Softwood and hardwood.

Technical information:
Cutterhead with changing knives R 5/8, R 6/9, R 7/10, R 3/12, bevelling knives 30/45/60° and axially parallel knives. For cutting radii and dowel profiles as well as bevelling and copy-shaping of curved workpieces using templates.

Radii profile R 5 - 12 mm or 30/45/60° bevel

Profile cutterhead D-165 mm

Profile cutterhead ProfilCut Q

Application:
For radii and bevel profiles with different profile knives. Copy shaping of curved workpieces using template and ball bearing guide ring.

Machine:
Spindle moulders and moulders.

Workpiece material:
Softwood and hardwood.

Technical information:
Cutterhead with change knives and straight cut. Multi-purpose application for different profiles.

Profile cutterhead set ProfilCut Q - bevelling / rounding

Application:
Multi-purpose tool set for bevelling, rounding and jointing the workpiece edges at the same time.

Machine:
Spindle moulders, copy shaping and profile moulders.

Workpiece material:
Softwood and hardwood.

Technical information:
With a combination of jointing and bevelling/rounding cutterheads, different profiles and wood thicknesses can be machined. Profile knives with different radii/bevels can be mounted in one cutterhead.

Type of operation

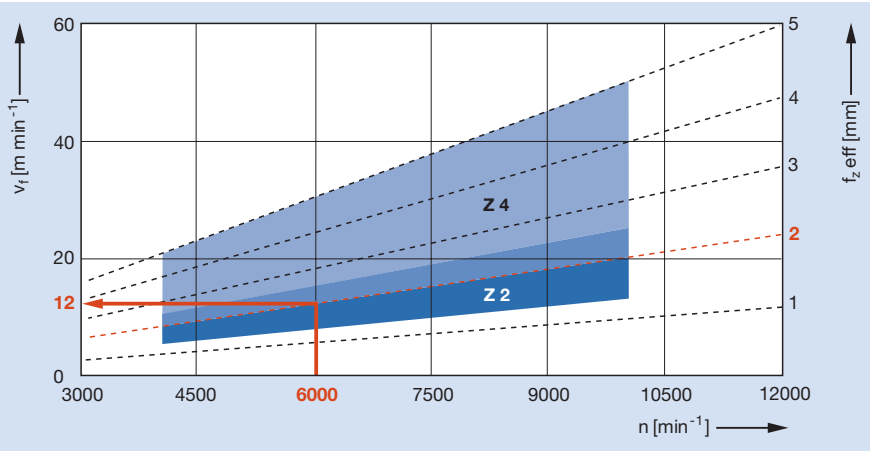

The tools described in the following section are suitable for making many different profiles. This includes profiling in craft or industry, the relevant product descriptions provide a reference when using a specific tool, and the type of woods processed.

The introduction to each section gives general notes and application regulations.

Relation between surface quality and length of knife marks $f_{z\ eff}$

Feed speeds depending on RPM, length of knife marks and number of teeth

With multi blade tools, only the marks of one knife show on the surface (one knife finish). Z 2 and Z 4 tools produce the same surface quality with same machine setting. High numbers of teeth are required for a high hogging performance.

Workpiece materials, machines, application

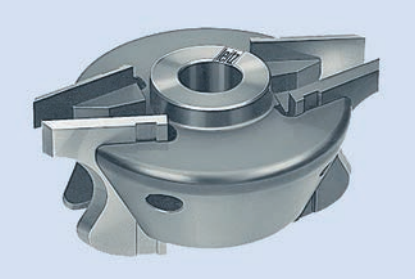

Please refer to the relevant product pages depending on the operation and profile.

Tool system

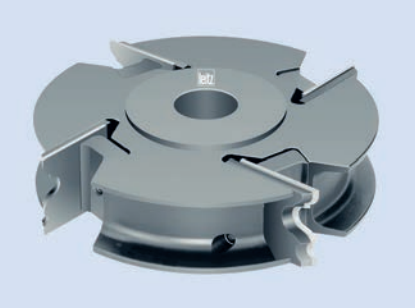

WM 500 1 04 Profile cutterhead with limitor, tool body in aluminium.

For profile depths up to maximum 15 mm and cutting widths of 50 mm. (WM 510 1 03)
For profile depths up to maximum 15 mm and cutting widths of 40 mm. (WM 500 1 04)
For small companies or craft. For spindle moulders or combination machines. More than 127 standard profile cutters and limitors available. If required Leitz can supply profile knives and limitors in HS quality to a special shape. Only a drawing or wood sample of the required profile is necessary to produce the special knives.

WM 530 1 01 Profile cutterhead.
WM 530 1 02 Profile cutterhead.
WM 520 1 Profile cutterhead.
WM 540 1 Profile cutterhead.

For big profile depths up to maximum 45 mm and cutting widths up to 80 mm. Suitable for small and medium sized companies to produce special profiles. For machines with manual feed. Special profile knives in HS quality can be produced by the Leitz service stations on request. Only a sketch or wood sample of the required profile is necessary to produce special profile knives.

Profile cutterhead VariForm.

VariForm cutterheads are available in different designs and dimensions. The tool body is designed for mech. feed without limitor or for manual feed with limitor depending on the application. Please select the correct type of cutterhead for each application from the diagram below.

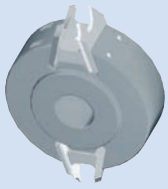

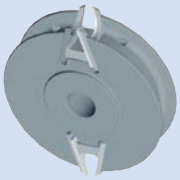

Design variation	Profile depth up to 15/19 mm	Profile depth up to 20 mm	Profile depth up to 35 mm
MAN-feed For spindle moulders	 Multi-purpose tool body	 Part profiled tool body, U-profile	 Profiled tool body, cranked right/left
Cutting width	40/45 mm a. 50/60 mm	45/45 mm a. 50/60 mm	40 mm to 60 mm

HS-special profiles and SP-profile limitors

PG I	Set of profile knives	SB = 60 mm
PG II	Set of profile knives	SB = 60 mm
PG I	Set of profile knives	SB = 80 mm
PG II	Set of profile knives	SB = 80 mm
Set consists of:		2 HS-Profile knives 2 SP-Limitors

Profile knives and limitors are produced to customer's profile.
Only use this cutterhead with original Leitz profile knives and limitors!

Profile cutterhead

Application:
For deep profiles with large profile depth, maximum 45 mm depth, with resharpenable profile knives and limitors. Easy to use, no setting gauge required.

Machine:
Spindle moulders and moulders.

Workpiece material:
Softwood and hardwood.

Technical information:
Cutting width up to 80.0 mm. Symmetrical tool body for right hand or left hand rotation as required.

MAN feed for symmetric closed profiles SB 60 - 80 mm
WM 540 1

Profile cutterhead VariForm

Application:
For cutting profiles. Different knives with maximum 15 mm profile depth can be mounted.

Machine:
Spindle moulders and moulders, double-end tenoners, edgebanding machines etc.

Workpiece material:
Softwood and hardwood (HW-30F), panel materials or glued wood (HW-10F).

Technical information:
Multi-purpose profile cutterhead for MAN feed with tungsten carbide special profile knives and backing plates and limitors. Resharpenable 3 to 4 times.

Tool body, MAN feed, Z 2
TT 531 1

Instruction manual visit www.leitz.org

Problem	Possible cause	Action
Surface errors Cutting quality	– RPM too low	Increase RPM and cutting speed, increase tool diameter
	– Wrong cutting geometry (shear angle too small for solid wood)	Measure, change tool
	– Spindle and tool tolerances too big	Check motor bearings and tolerances
	– Unbalanced tool	Check and balance
	– Cutting speed too high (tool rubs), number of teeth: feed speed ratio incorrect	Increase feed speed, reduce no. of teeth and RPM
	– Too few teeth, too high feed speed	Adjust number of teeth and feed speed accordingly
Wavy, rough surface	– Irregular workpiece feed	Check feed or conveyor unit
	– Low feed roller pressure, worn feed rollers	Increase feed roller pressure and rema-chine grooves in rollers
	– Workpieces too narrow or too short	Pay attention to machine manufacturer's guidelines
	– Chip removal too high	Pre-relieve or machine in several passes
	– Resin built up, or blunt tool	Clean and sharpen tool regularly
Surface errors Burn marks	– Cutting speed too high	Reduce RPM
	– Feed speed: number of teeth ratio wrong	Adjust number of teeth and feed speed accordingly
	– Tool rotates on stationary workpiece	Ensure constant feed through the machine
Surface errors Tear outs	– Wood moisture content too low	Check drying process
	– Knotty wood	Optimise with crosscut saw and longitudinal joints
Surface errors Chip marks	– Incorrect cutting geometry for workpiece material	Check, adjust or use new tool
	– Gap between knife and wedges	Clean and carefully mount knife and wedge
	– Gullet too small	Check and enlarge
	– Extraction hood and chip removal unit insufficient	Contact machine manufacturer
	– Weak dust extraction	Guideline: 30 m s^{-1} air speed
Profile error in workpiece – angle error – uneven	– Tool profile sets not identical, e.g. with sets for cutting with/against feed	Check and adjust tool set
	– Spindle not exactly vertical in feed direction or table plane	Check spindle is vertical with dial gauge at two positions with moving spindle (top and bottom of spindle)
	– Worn table and fence	Rework or replace table and fence
	– Angle tolerance between table and fence too large or incorrect adjustment of fence and zero line	Check and adjust angles, adjust fence to tool zero diameter
Power consumption of motor Feeding force	– Resin built up on tool, blunt tool	Clean and sharpen tool regularly
	– Tool gullet too small	Check and correct
	– Shear angle too small	Correct or use new tool
	– Cutting section too large	Relieve profile or machine in several passes

Rounding of cutting edges
Mechanical abrasion causes continuous rounding to the cutting edge when machining uniform materials.

The machined surface quality determines the size of the cutting edge wear. As a standard the width of wear VB of 0.2 to maximum 0.3 mm should not be exceeded.

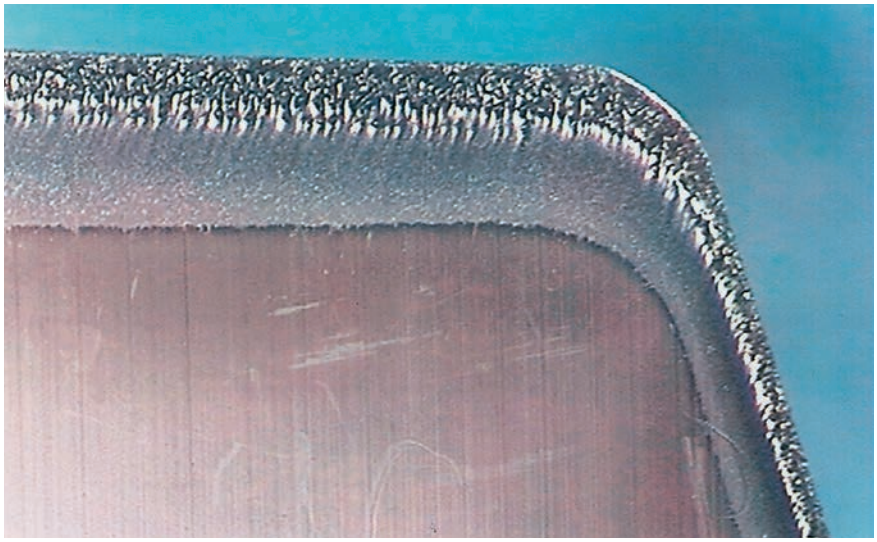

Tipped tools must be resharpened regularly to ensure the economic efficiency of the tool.

Typical cutting edge wear after machining spruce.

Chemical wear to cutting edges
When machining workpiece materials with a high tannic acid content (e.g. oak), the wear to the cutting edges is a combination of mechanical and chemical wear.

The cobalt binder material in the tungsten carbide is etched away by a chemical action prematurely damaging the cutting material.

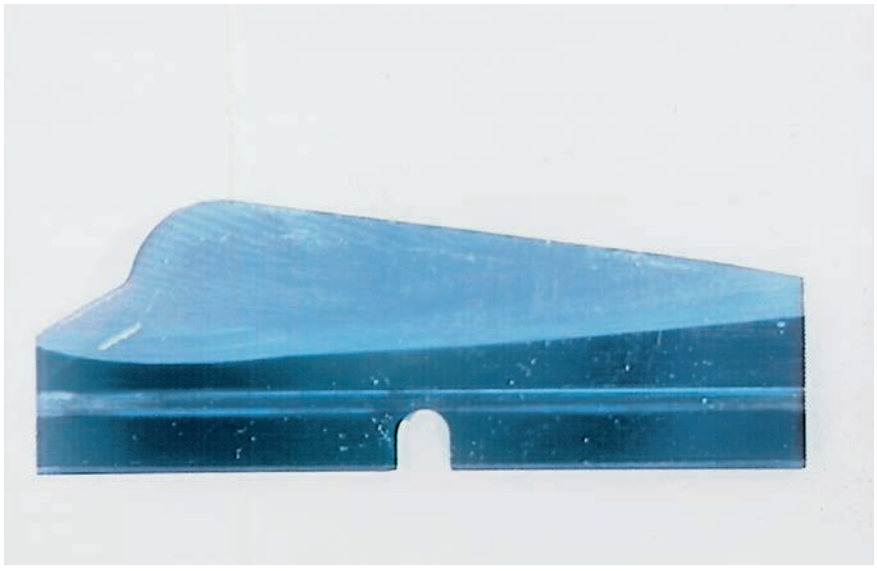

Chemical influence – cutting edge wear – after machining of oak.

Cutting edge damage through incorrect repair
With cutterhead/cutter set tools with HW cutting edges, the knives must be turned or replaced at the end of their performance time.

Resharpening on the face is not possible for safety reasons as it leads to a loss of clamping force and gaps between the knife and the clamping wedge, affect the surface quality.

Tools with turnblade/replaceable knives must be thoroughly cleaned and carefully mounted when changing knives.

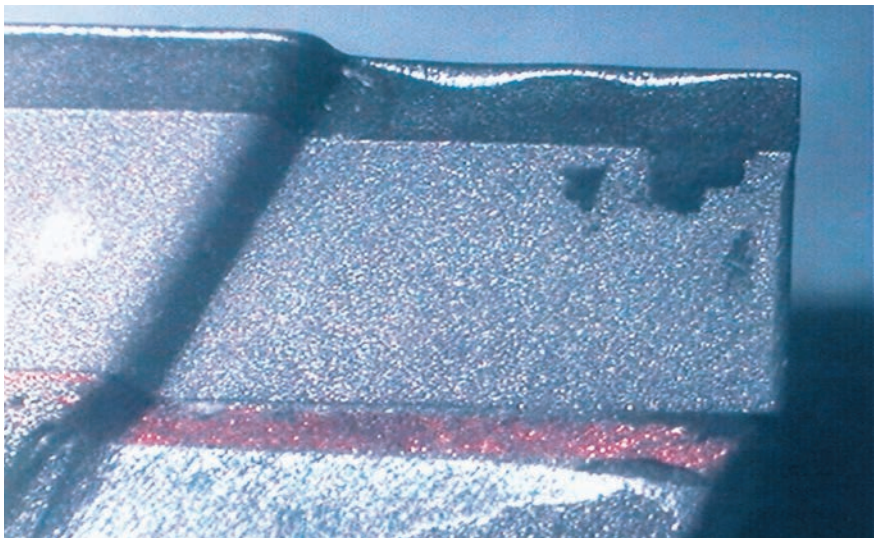

Damaged cutting edges due to incorrect repair.

Rounding of cutting edges
Mechanical abrasion causes continuous rounding to the cutting edge when machining uniform materials.

Resin build up can develop on the cutting edges because of the long performance time.

The machined surface quality determines the size of the cutting edge wear. As a standard the width of wear VB of 0.2 to maximum 0.3 mm should not be exceeded.

Run time performance can be increased by removing the resin build-up.

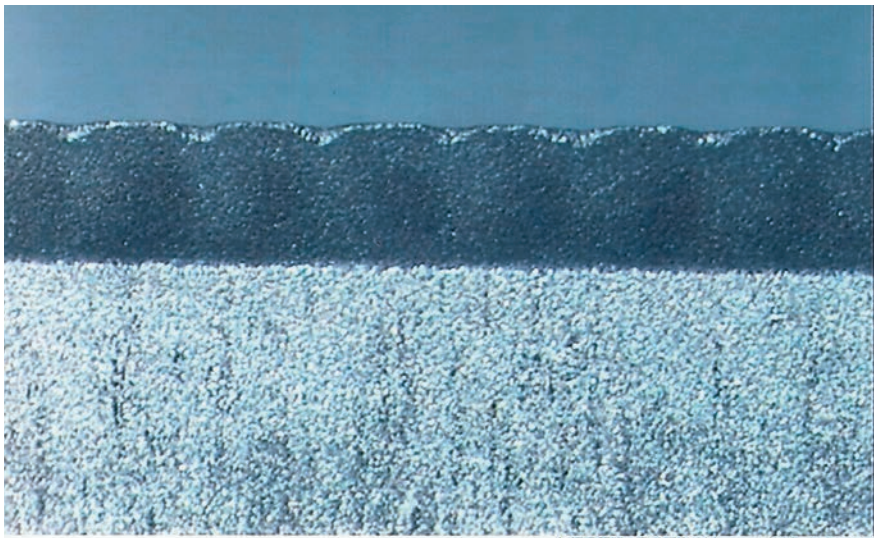

Cutting edge wear after machining GFK.

Rounding cutting edges and small chips
The cutting edge is damaged by small chips not caused by the usual wear when machining some wood-derived materials.

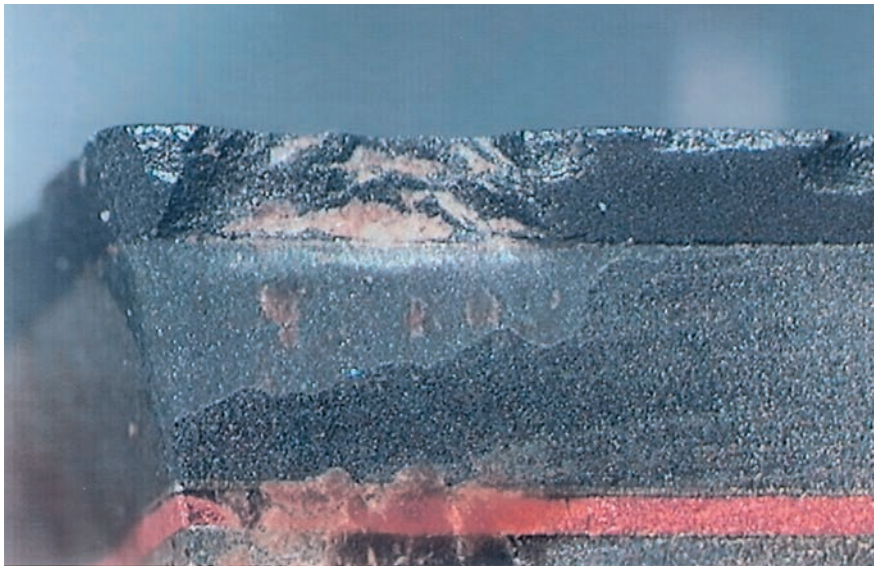

This is usually caused by foreign objects such as mineral particles in the workpiece material.

The wear to the cutting edges and the size of the chips to the cutting edge are important factors for economically efficient repair. Increasing cutting forces can totally destroy the cutting edges.

Cutting edge wear and cracks after machining HPL/CPL.

Cutting edge destruction
The cutting edge can be destroyed when machining non-uniform materials containing mineral or metallic particles. These particles cannot be detected prior to machining and limit the use of DP (DIA) tools for machining such materials.

Cutting edge destruction by metallic particles.

Wood-derived	☐ top layer	☐ middle layer	☐ top layer and middle layer

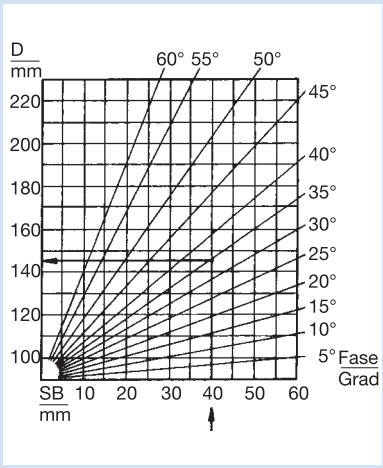

Technical information:

Tipped tool (bevel-/profile router):
Design: BG-Test, Z 2, round design
mech. feed, Z 3, Z 4, round design,
tooth shape: with/without spurs

Chart to determine min. tool diameter:
Valid for bevel cutterblock BO – 30 mm:
For bore 40 mm:
D + 10 mm
For bore 50 mm:
D + 20 mm

Formula to determine tool diameter:
Valid for profile cutterblock BO – 30 mm:
For bore 40 mm: D + 10 mm
For bore 50 mm: D + 10 mm
Formula: D_{min} = 100 + 2 x PT (mm)

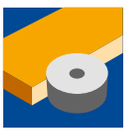

Note:
Angles exceeding 45° and large profile depths require large diameters. The maximum possible RPM for the cutterblock diameter must not be exceeded. Profile sketches or profile drawings must show clearly if the workpiece material (wood) or cutterblock is shown. Please state side to table, direction of rotation, dimensions and conditions of application on all workpiece samples or drawings.

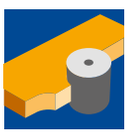

Tool combination with turnblade-/exchangeable knives:
Formula: D_{min} = 80 x 2 x PT (mm) – Valid for BO – 30 mm

Sketch for application plan, profile drawing, special motor spindle, etc.
Please specify workpiece support and fence side and/or workpiece face side top/bottom.

Leitz Lexicon Edition 7 | Version 3 | 07/2025

Explanation of abbreviations

A	=	dimension A
a_e	=	cutting thickness (radial)
a_p	=	cutting depth (axial)
ABM	=	dimension
APL	=	panel raising length
APT	=	panel raising depth
AL	=	working length
AM	=	number of knives
AS	=	anti sound (low noise design)
b	=	overhang
B	=	width
BDD	=	thickness of shoulder
BEM	=	note
BEZ	=	description
BH	=	tipping height
BO	=	bore diameter
CNC	=	Computerized Numerical Control
d	=	diameter
D	=	cutting circle diameter
D0	=	zero diameter
DA	=	outside Diameter
DB	=	diameter of shoulder
DFC	=	Dust Flow Control (optimised chip clearance)
DGL	=	number of links
DIK	=	thickness
DKN	=	double keyway
DP	=	polycrystalline diamond
DRI	=	rotation
FAB	=	width of rebate
FAT	=	depth of rebate
FAW	=	bevel angle
FLD	=	flange diameter
f_z	=	tooth feed
$f_{z\ eff}$	=	effective tooth feed
GEW	=	thread
GL	=	total length
GS	=	Plunging edge
H	=	height
HC	=	tungsten carbide, coated
HD	=	wood thickness (thickness of workpiece)
HL	=	high-alloyed tool steel
HS	=	high-speed steel (HSS)
HW	=	tungsten carbide (TCT)
ID	=	ident number
IV	=	insulation glazing
KBZ	=	abbreviation
KLH	=	clamping height
KM	=	edge breaker
KN	=	single keyway
KNL	=	combination pinhole consists of 2/7/42 2/9/46,35 2/10/60
L	=	length
l	=	clamping length
LD	=	left hand twist
LEN	=	Leitz standard profiles
LH	=	left hand rotation
M	=	metric thread
MBM	=	minimum order quantity
MC	=	multi-purpose steel, coated
MD	=	thickness of knife
min^{-1}	=	revolutions per minute (RPM)
MK	=	morse taper
m min^{-1}	=	metres per minute
m s^{-1}	=	metres per second
n	=	RPM
$n_{max.}$	=	maximum permissible RPM
NAL	=	position of hub
ND	=	thickness of hub
NH	=	zero height
NL	=	cutting length
NLA	=	pinhole dimensions
NT	=	grooving depth
P	=	profile
POS	=	cutter position
PT	=	profile depth
PG	=	profile group
QAL	=	cutting material quality
R	=	radius
RD	=	right hand twist
RH	=	right hand rotation
RP	=	radius of cutter
S	=	shank dimension
SB	=	cutting width
SET	=	set
SLB	=	slotting width
SLL	=	slotting length
SLT	=	slotting depth
SP	=	tool steel
ST	=	Cobalt-basis cast alloys, e.g. Stellite™
STO	=	shank tolerance
SW	=	cutting angle
TD	=	diameter of tool body
TDI	=	thickness of tool
TG	=	pitch
TK	=	reference diameter
UT	=	cutting edges with irregular pitch
V	=	number of spurs
v_c	=	cutting speed
v_f	=	feed speed
VE	=	packing unit
VSB	=	adjustment range
WSS	=	workpiece material
Z	=	number of teeth
ZA	=	number of fingers
ZF	=	tooth shape (cutting edge shape)
ZL	=	finger length

Notes to the Lexicon concerning the diagrams and tables

The statements made in the diagrams and tables relate to specific conditions and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

Alphabetical product index 160

ID index 162

Working step/Application	Sizing and grooving.
Workpiece material [recommended cutting material]	Softwood and hardwood [SP - softwood only, HS, HW, HW solid]. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. [HW, HW solid, DP]. Plywood [HW, HW solid, DP]. Duromers [HW, HW solid, DP]. Plastomers [HS, HW, HW solid, DP]. Solid surface material (Corian, Varicor etc.) [HW, HW solid, DP]. Decorative laminates (HPL-compact laminate, Trespa etc.) [HW solid, DP]. Non-ferrous metal (Aluminium, copper etc.) [HS, HW, HW solid, DP]. In order to avoid melting and build-up on the cutting edge when machining aluminum, carbide tools should be operated using cooling lubricants (emulsion or minimum quantity lubrication MQL).
Machine	Stationary routers with/without CNC control. Milling machines with spindles to mount shank tools. Portable routers.
Operation	Sizing, separating cuts (full cut), climb cut, conventional cut.
Cutting edge type	**Straight cutting edge**

Straight edges with shear angle.

Straight edges with shear angle, spiral design.

Spiral cutting edges

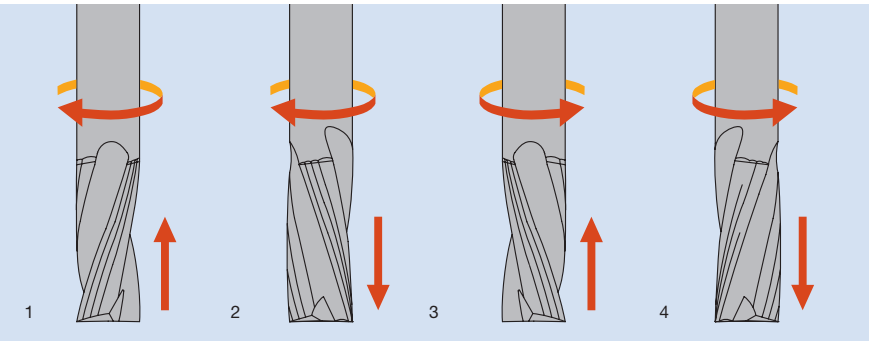

Fig. 1: RH-RD
positive twist,
workpiece face side to bottom,
good chip flow into dust extraction.

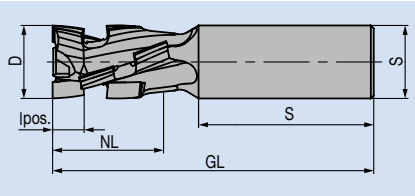

Fig. 2: RH-LD
negative twist,
workpiece face side to top,
supports workpiece clamping.

Fig. 3: LH-LD
positive twist,
workpiece face side to bottom,
good chip flow into dust extraction.

Fig. 4: LH-RD
negative twist,
workpiece face side to top,
supports workpiece clamping.

Technical features

The dimensions in the table below refer to the following tool parameters:

D	Diameter of the cutting edge
NL	Usable cutting length with specified number of teeth
AL	Possible working length, reached in separate steps
GL	Total length of the tool
S	Diameter of the shank, e.g. S25 x 60 -> Ø 25 mm Maximum clamping length of the shank, e.g. S25 x 60 -> 60 mm
lpos.	Length of the positive axis angle for tools with alternating twist

Shank tolerances

	Shank diameter	
Tools for	< 12 mm	≥ 12 mm
CNC routers	h6	g6
Portable routers	g7/h8	–

Application parameters

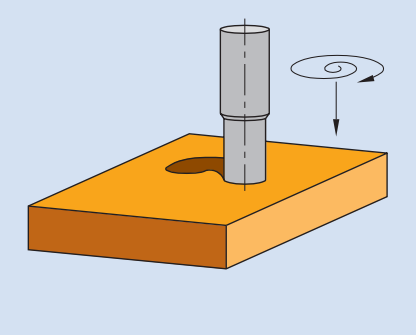

RPM/feed speed
The recommended RPM and feed speeds are detailed in the diagrams next the tool tables.

Operation notes

Recommended plunging methods:
The following plunging methods are recommended for sizing and grooving tools:

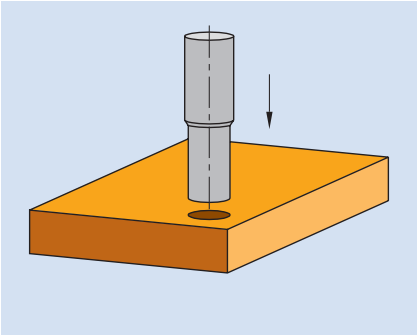

Ramp plunging

Spiral plunging

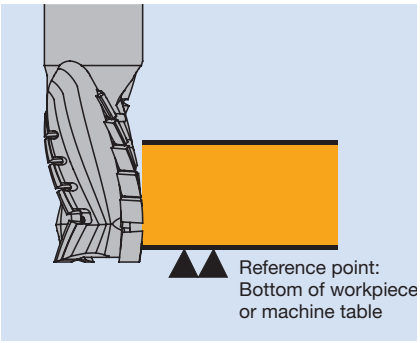

Router bits with mainly negative cutting shear angles and HW solid router bits with RH/LD and LH/RD and router bits without plunging edge are not suitable for axial plunging.

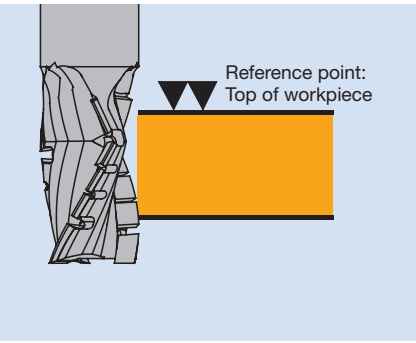

Axial plunging

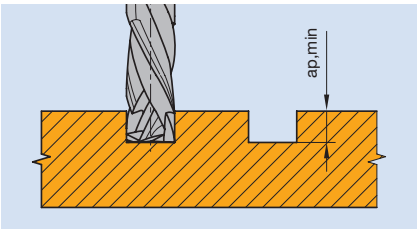

Position the tool relative to the workpiece

Tools with high negative shear angle.

Tools with high positive shear angle..

Tools with alternating twist should plunge at least 0.5 mm deeper into the material than the specified lpos.
$a_{p\ min}$ = lpos. + 0.5 mm

Workpiece clamping

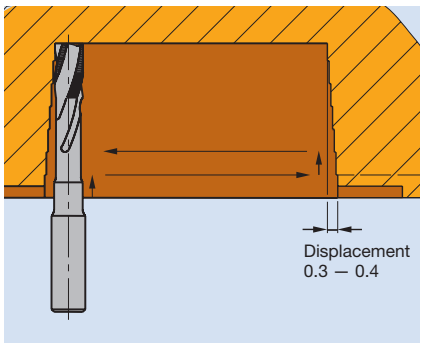

Sufficient workpiece clamping is very important on stationary machines. Insufficient clamping can reduce both the cut quality and tool life considerably. Panels can be held in place with vacuum clamping, but sometimes additional mechanical clamping is required.
Small and and arched workpieces in particular require special jigs or clamping devices which must be made by the customer or sourced from specialist suppliers.

Chip removal

For optimum chip removal, tools with predominantly or only positive shear cut should be used. Check there is sufficient workpiece clamping.

Machining deep slots

Cutting lock mortises in door production.

Reducing the slot cutting width by approx 0.1 mm per stroke reduces the risk of breakage as the tool does not touch the side of the slot with the full length of the tool.

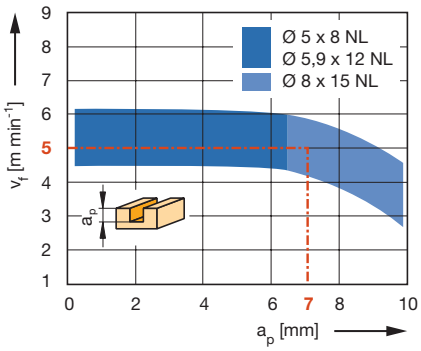

HW

Feed speed v_f depending on cutting depth a_p

Workpiece material: Duromers, plastomers, compound materials
Operation: Grooving, sizing
Speed: n = 16000 - 18000 min^{-1}

Grooving cutter, straight cut

Application:
Router cutter for grooving.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools, portable routers.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), duromers, plastomers, solid surface material (Corian, Varicor etc.), decorative laminates (HPL-compact laminate, Trespa etc.), non-ferrous metals (aluminium, copper etc.), PVC profile extrusions.

Technical information:
Straight cut. End-ground for plunging. Large resharpening area. Good cutting performance in plastic and compound materials. When machining aluminum, carbide tools should be operated using cooling lubricants (emulsion or minimum quantity lubrication MQL).

HW solid, Z 1
WO 120 2

RPM: n_{max} = 24000 min^{-1}

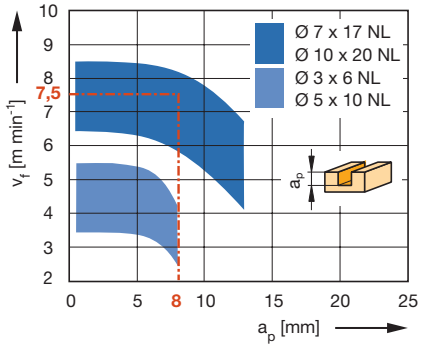

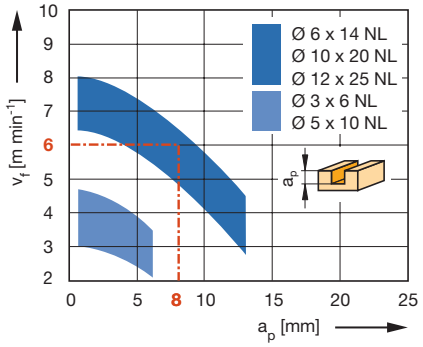

HW

Feed speed v_f depending on cutting depth a_p

Workpiece material: Plastic coated chipboard
Operation: Grooving
Speed: n = 18000 min^{-1}
Correction factor for v_f:
Solid wood = 0.8; Glulam = 0.8;
Machining across grain = 0.7

Grooving cutter, straight cut

Application:
Router cutter for sizing and grooving.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools, portable routers.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), duromers, plastomers, solid surface material (Corian, Varicor etc.), decorative laminates (HPL-compact laminate, Trespa etc.), non-ferrous metals (aluminium, copper etc.), PVC profile extrusions.

Technical information:
Straight cut. End-ground for plunging. Large resharpening area. Short design for increased stability and reduced vibration. Long design for increased cutting depth (recommended in several steps). When machining aluminum, carbide tools should be operated using cooling lubricants (emulsion or minimum quantity lubrication MQL).

HW

Feed speed v_f depending on cutting depth a_p

Workpiece material: Plastic coated chipboard
Operation: Sizing
Speed: n = 18000 min^{-1}
Correction factor for v_f: MDF = 0.8

Router cutter in turnblade design

Application:
Router cutter for sizing and grooving to finish quality. For grooving with constant tool diameter.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc.

Technical information:
Straight cut. Teflon coated tool body for reduced resin and glue build up. Limited suitable for finish cut. Cutting edge overlap visible on workpiece. With tungsten carbide turnblade knife plunging tip.

HW, Z 1+1, with 50 mm/30 mm turnblade knives

Feed speed v_f depending on grooving depth a_p
1 = Jointing cut a_e = 0.5 - 2 mm
2 = Sizing cut

Workpiece material: Plastic coated chipboard
Operation: Jointing, sizing
Speed: n =18000 min^{-1}
Correction factor for v_f:
Machining across grain = 0.7; MDF = 0.8

Router cutter in turnblade design

Application:
Router cutter for sizing, grooving and finish cutting to finish quality. Z 2 for increased feed rates.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Straight cut. Knife tip designed for seamless cut. Design with plunging tip limited suitable for axial plunging. Suitable for machining the narrow edge of painted or foil coated MDF.

T-groove cutter

Application:
Router for slotting, grooving and undercutting

Machine:
Routing machines with/without CNC conrol. CNC machining centres, special milling machines with cutting spindles to adapt shank tools.

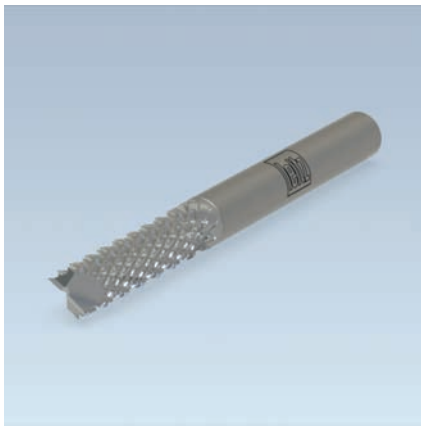

Workpiece material:
Aluminium, aluminium extruded profiles, thermoplastics

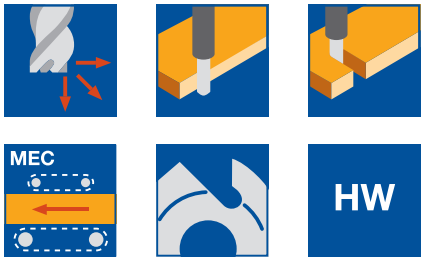

Technical information:
Long version for increased cross sections. When machining aluminum, carbide tools should be operated using cooling lubricants (emulsion or minimum quantity lubrication MQL).

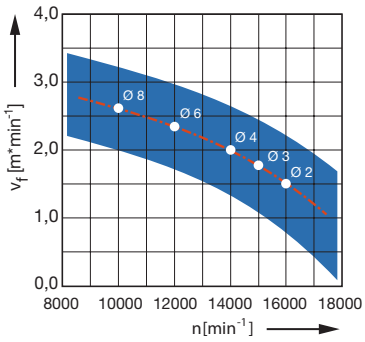

Disc cutter HW-solid, Z 4

Grooving cutter, serrated

Application:
Router for sizing, slotting, splitting and delamination-free machining.

Machine:
Routing machines with/without CNC conrol. CNC machining centres, special milling machines with cutting spindles to adapt shank tools.

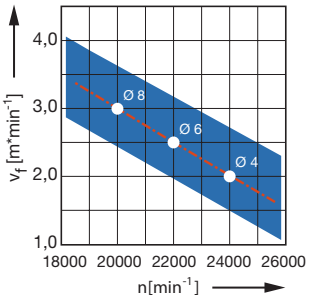

Workpiece material:
Carbon fiber materials with duroplastic binders (thickness 1,5 - 4 mm).

Technical information:
Special cutting edge geometry for delamination-free machining, no edge break-outs as well as high surface qualities due to alternating shear angle.

Slotting extrusions

Spiral finishing router cutter

Application:
Router for grooving plastic and aluminium profile extrusions. Especially to produce drainage grooves in plastic window profiles.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood, duromers, plastomers, sandwich panels (PU foam cores with aluminium cover etc.), NF-metals (aluminium, copper etc.).

Technical information:
When machining aluminum, carbide tools should be operated using cooling lubricants (emulsion or minimum quantity lubrication MQL).

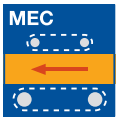

HW solid, Z 1, extended version

HW

Spiral finishing router cutter

Application:
Router cutter for sizing, grooving and finish cutting. For high demands on finish quality.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

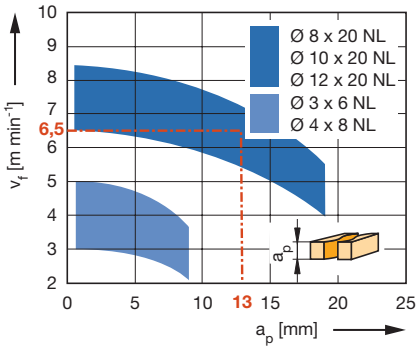

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), duromers, plastomers, solid surface material (Corian, Varicor etc.), decorative laminates (HPL-compact laminate, Trespa etc.), NF-metals (aluminium, copper etc.).

Technical information:
Large twist angle for high shear cut. Check twist direction for good top layer cut quality. Maximum cutting depth 1.0 - 1.5 x D. Short design for increased stability and reduced vibration. Long design for increased cutting depth (recommended in several steps). When machining aluminum, carbide tools should be operated using cooling lubricants (emulsion or minimum quantity lubrication MQL).

Spiral finishing router cutter

Application:
Router for sizing, slotting and splitting.

Machine:
Routing machines with/without CNC conrol. CNC machining centres, special milling machines with cutting spindles to adapt shank tools.

Workpiece material:
Thermoplastics, PVC window profiles.

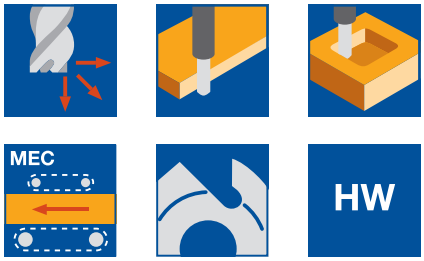

Technical information:
Universally applicable for good cutting results in sizing. Lefthand twist for perfect cutting edge.

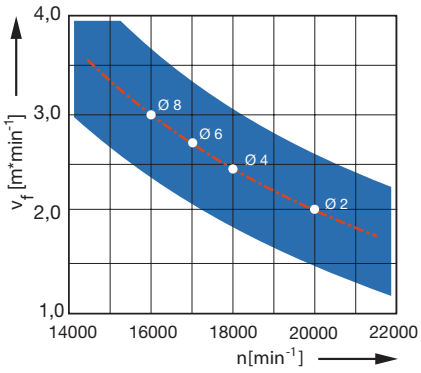

HW-solid, Z 1, lefthand twist

Spiral finishing router cutter

Application:
Router for sizing, grooving, pocket milling, slotting, splitting and axial plunging.

Machine:
Routing machines with/without CNC conrol. CNC machining centres, special milling machines with cutting spindles to adapt shank tools.

Workpiece material:
Aluminium, aluminium extruded profiles, aluminium composite panels.

Technical information:
Special cutting geometry for high surface qualities and burr-free cutting edges. Short machining times with long tool life. When machining aluminum, carbide tools should be operated using cooling lubricants (emulsion or minimum quantity lubrication MQL).

Feed speed v_f depending on cutting depth a_p

Workpiece material: Plastic coated chipboard
Operation: Sizing
RPM: n = 18000 min^{-1}
Correction factor for v_f: MDF = 0.8; Uncoated chipboard = 1.1

Router cutter Diamaster PRO

Application:
Router for sizing and grooving with continuous cutting edge.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

Workpiece material:
Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., duromers, plastomers, laminated materials (HPL-compact laminate, Trespa, multiplex plywood).

Technical information:
Solid tungsten carbide tool body for increased stability and smooth running. DP face edge suitable for plunging. Slightly positive shear angle for improved chip removal when ramp plunging. Axial infeed for grooving and sizing maximum 1.0 - 1.5 x D. Resharpenable up to 3 times with normal wear.

Feed speed v_f depending on cutting depth a_p

Workpiece material: Plastic coated chipboard
Operation: Jointing
Speed: n = 18000 min^{-1}
Correction factor for v_f: MDF = 0.9; Veneer across grain = 0.7

Router cutter Diamaster PRO

Application:
Router cutter for sizing and grooving with continuous cutting edge. Particularly suitable for machining MDF with direct lacquering or foil coating of the machined edges.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

Workpiece material:
Hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., duromers, plastomers, laminated materials (HPL-compact laminate, Trespa, multiplex plywood).

Technical information:
Negative shear angle (only for ID **091158**) for tear-free edges during grooving and to support the workpiece clamping of smaller parts. Resharpenable 3 to 5 times with normal wear. Maximum chip removal 4 mm; roughing cut required for higher chip removal.

Router cutter Diamaster PRO

Application:
Router cutter for sizing and grooving (Nesting) at high feed speeds. For tear free cut edges on both sides of the workpiece.

Machine:
Overhead routers with/without CNC control, machining centres, special routers with spindles for mounting shank tools.

Workpiece material:
Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Spiral cutting edge arrangement with alternate shear angle and real - Z 2 over the complete cutting length, with DP plunging tip. Resharpenable up to 3 times with normal wear. Tool body made from high-tensile material. Important to follow the application data parameters. Tools with increased length of positive shear angle for optimized chip collection in the direction of the extraction hood – Leitz DFC®.

Workpiece material: Plastic coated chipboard
Operation: Sizing
Speed: n = 18000 min^{-1}
Correction factor for v_f: MDF = 0.8; Uncoated chipboard = 1.1; Veneer across grain = 0.7

Router cutter Diamaster PRO

Application:
Router cutter for sizing and grooving with increased performance time in engineered wood boards. For tear-free cut edges on both sides of the workpiece. Suitable for right hand and left hand cutting (e.g. protective cutting) without tool change.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

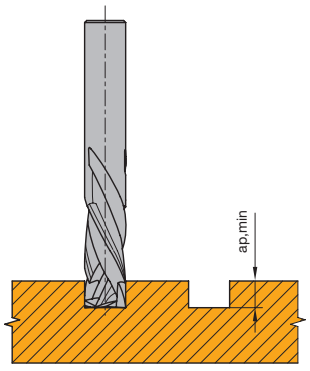

Workpiece material:
Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., for tear-free edges on both sides of coated workpieces.

Technical information:
Spiral cutting edge arrangement with tungsten carbide plunging tip. Right hand rotation: Z 3+3, left hand rotation: Z 2+2. Resharpenable 3 to 5 times with normal wear. Right and left hand rotation in one tool (by adjusting the Z-axis and changing the direction of rotation).

Spiral cutting edge arrangement with alternate shear angle and DP plunging tip. Enlarged shear angle for excellent edge quality for sensitive and brittle decorative papers, laminating foils and veneers. Resharpenable 5 to 8 times with normal wear. Precutting the workpieces is recommended. Especially suitable on CNC machining centres with laser edgebanding technology. Cuts to be painted in MDF require finishing with tools with continuous edges.

HS

Application example of cutting slots
a_p = 0.8 mm (reciprocating movement)

Slot mortising bits

Application:
Router cutter for cutting tear-free longitudinal slots with stepwise infeed.

Machine:
Special routers with reciprocating spindles.

Workpiece material:
Softwood and hardwood.

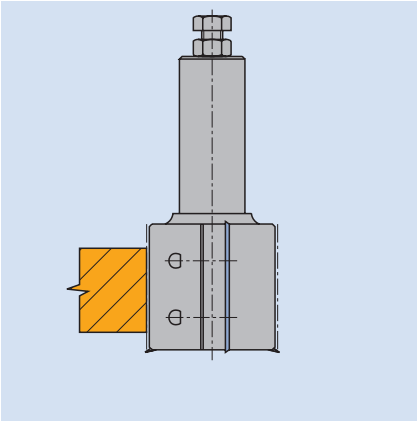

Technical information:
For softwood and hardwood. Suitable for right hand and left hand rotation, tools resharpenable on the face side. Constant diameter after sharpening.

RPM: n = 4500 - 9000 min^{-1}

Working step/Application	Jointing, rebating and bevelling.
Workpiece material [recommended cutting material]	Softwood and hardwood [HW]. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. [HW, DP]. Plywood [HW, DP]. Duromers [HW, DP]. Plastomers [HW, DP]. Solid surface material (Corian, Varicor etc.) [HW, DP].
Machine	Stationary routers with/without CNC control. Milling machines with spindles to mount shank tools.
Operation	For conventional and climb cut operations, limited chip removal.

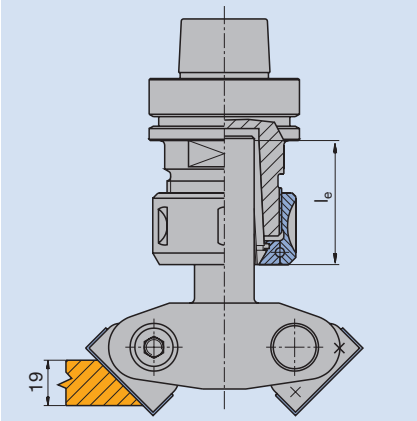

Jointing

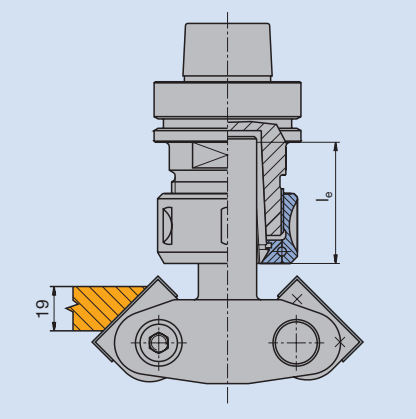

Rebating

Bevelling with adjustable bevel cutterhead

Bevelling top edge

Bevelling bottom edge

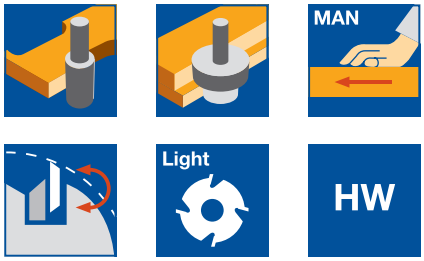

Note:
When bevelling from below, the minimum shank clamping length l_e must be observed. Under no circumstances must the tool be clamped at a shorter length.

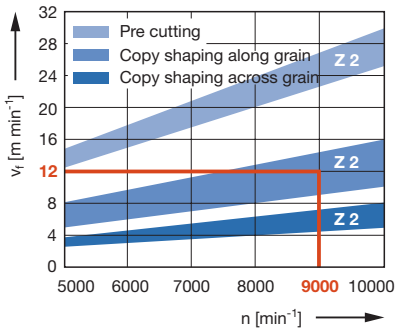

Shank d x e	l_e min [mm]
20 x 50	40
25 x 60	45

d = Shank diameter
e = Shank length

Application parameters	**RPM/feed speed** The recommended RPM and feed speeds are detailed in the diagrams next the tool tables.
Information	Smooth cutting results can only be achieved with tools having a continuous cutting edge. Spurs are required when rebating solid wood.
Workpiece clamping	Sufficient workpiece clamping is very important on stationary machines. Insufficient clamping can reduce both the cut quality and tool life considerably. Panels can be held in place with vacuum clamping, but sometimes additional mechanical clamping is required. Small and arched workpieces in particular require special jigs or clamping devices which must be made by the customer or sourced from specialist suppliers.

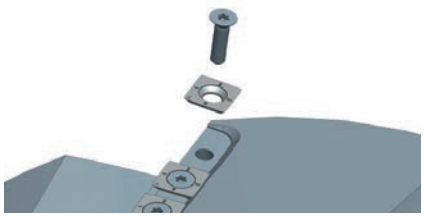

Feed speed v_f depending on the number of teeth Z and speed n for solid wood (pre trimming and copy shaping)
Example for tool diameter 125 mm:
n = 9000 min^{-1}
Z 2
Application:
copy shaping along the grain
v_f = 12 m min^{-1}

Order example:
Tool set ID **132737** mounted on arbor ID **042951**, HSK-F 63 (A = 80 mm). When giving the arbor ID observe the required clamping diameter.

Copy shaping cutterhead - HeliCut 15

Application:
For pre-cutting, jointing and copy shaping of large cutting depths, along and across to the fibre direction. For copy shaping of arched workpieces with template, ball bearing and guide ring, as well as for the application on CNC controlled stationary routers e.g. joinery machines, window manufacturing plants.

Machine:
Spindle moulders and profile milling machines, double-end tenoner, stationary routers with/without CNC control.

Workpiece material:
Softwood and hardwood, glulam and laminated wood.

Technical information:
Noise reduced design with staggered knives, applicable for MAN and MEC. Mountable on clamping arbor. Also applicable for rebating. Application of the same knives as peripheral knife and spur. The cutting edges of the HW knives are numbered. No clamping wedges, direct tangential knife clamping thus easy handling of the knife change without further setting gaugesd. By default mounted with HW turnblade knives ID **009543**.

Jointing and rebating cutterhead WhisperCut EdgeExpert

Application:
Optimized for noise reduced rebating and jointing particularly for sensitive decorative papers, foil coatings and veneers.

Machine:
Stationary routers with/without CNC control, machining centres.

Workpiece material:
Chip and fibre boards (MDF etc.) raw, veneered, painted and coated; especially for plastic, paper, HPL and anti-fingerprint coatings. Also suitable for surfaces in mat, high gloss or with relief structures.

Technical information:
DP tipped cutterhead with alternate shear angle for tear-free jointing edges and cutting surface. With rebating knife for tear-free rebating edges (up to 11 mm rebating width). Increased shear angle for excellent edge quality on sensitive decorative papers, foil coatings and veneers. Noise reduced design with up to 5 dB(A) noise reduction. Significant weight reduction by using an aluminium alloy tool body. Carrier body for multiple use with exchangeable throw-away knives (not resharpenable).

Working step/Application	Face milling, finish cutting.
Workpiece material [recommended cutting material]	Softwood and hardwood [HW]. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. [HW, DP]. Duromers [HW, DP]. Plastomers [HW, DP]. Solid surface material (Corian, Varicor etc.) [HW, DP].
Machine	Stationary routers with/without CNC control. Milling machines with spindles to mount shank tools.
Operation	For conventional and climb cut operations, limited chip removal.

Face milling

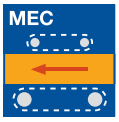

Finish cutting

Application parameters	**RPM/feed speed** The recommended RPM and feed speeds are detailed in the diagrams next the tool tables.
Information	Smooth cutting results can only be achieved with tools having a continuous cutting edge. In order to obtain a score-free finish during face milling, the machine spindle must be exactly vertical to the machine table. The larger the diameter of the planing cutter, the higher the risk of scoring and tool marks on the workpiece surface due to angular misalignment.
Workpiece clamping	Sufficient workpiece clamping is very important on stationary machines. Insufficient clamping can reduce both the cut quality and tool life considerably. Panels can be held in place with vacuum clamping, but sometimes additional mechanical clamping is required. Small and arched workpieces in particular require special jigs or clamping devices which must be made by the customer or sourced from specialist suppliers.

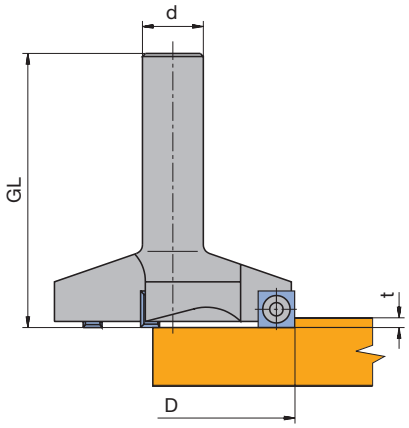

HW

Example

t max. = 10 mm

Surface planing of MDF spoilboards in nesting applications:
t = 0.3 - 1.5 mm
f_z = 0.3 - 0.8 mm
v_c = 58.6 - 70 m/s
(Attention: n max. must not be exceeded)

Example:
ID **041557**, v_c = 70 m/s, n = 7400 min^{-1}

Planing cutter - turnblade design HeliPlan

Application:
For surface planing of large workpieces and for cutting wide rebates in one operation.

Machine:
Stationary routers with/without CNC control, machining centres.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), duromers, plastomers, solid surface material (Corian, Varicor etc.).

Technical information:
Cutting edge with shear angle; reversible and replaceable knives. D 125, D 135 and D 180 particularly suitable for planing MDF spoilboards in nesting applications. Excellent cutting result through optimized cutting geometry.

HW

V-groove cutter

V-groove cutter 68° (ID **042932**)

V-groove cutter in turnblade design with point 68° (ID **042932**)

Turnblade finishing cutter, Z 1

Application:
For machining V-groove profiles and for multi-purpose carving operations (decorative groove, 90° corner etc.).

Machine:
Stationary routers with/without CNC-control, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Cutterhead with exchangeable turnblades. 2 or 3 (ID **042932**) performance times through turning the knife. Extra long design (ID **042937**) particularly suitable for carving operations on 5-axes machines.

DP

DP V-grooving cutter for composite panels

Application:
Routers for cutting V-grooves in composite panels for folding works.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

Workpiece material:
Composite panels based on thermoplastic cores with aluminium coverage on both sides (e.g. Alucobond®, Dibond® etc.).

Technical information:
DP edge with shear angle. Resharpenable 3 to 5 times with normal wear.

ProFix F cutterhead PF 25-15°

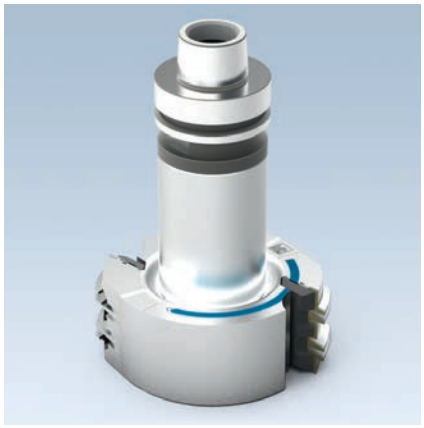

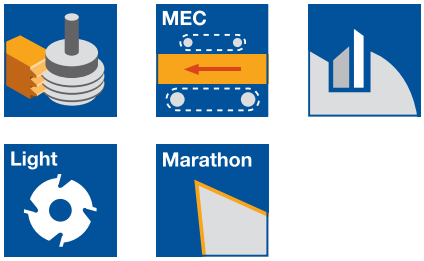

Working step/Application	For machining self-locking longitudinal joints for exactly measured workpieces, e.g. constructional finger joints, window and door profiles, mitred frames, arched joints, stair, furniture and shelf parts.
Cutting material	HS, HW (quality according to machined material).
Machine	Stationary routers with/without CNC, milling machines with spindles to mount tools with bore.
Tool design	ProFix tool body with bore for mounting on arbors. For ProFix finger joint knives without shear angle and with straight clearance.
RPM D_0 = diameter of the tool body	D_0 = 80 mm, n_{max} = 11000 min^{-1}. D_0 = 100 mm, n_{max} = 9000 min^{-1}.
Resharpening area	PF 25 = 4.5 mm.
Number of teeth/Cutting with	Z 2, SB max. = 80 mm.
Feed speed	Depends on the RPM, maximum 18 m min^{-1}.

	f_z [mm]
Softwood	0.30 – 0.40
Hardwood	0.40 – 0.50

$v_f = f_z \cdot n \cdot Z/1000$

Technical features	Tool body for resharpenable HS- or HW profile knives. Constant profile/diameter after resharpening. New and resharpened knives are always positioned and clamped at constant diameter by the ProFix clamping system. – Form and force knife clamping. – Knife clamping screws positioned behind the cutting edge, and in the dust protected area. – One tool body can be used for different finger and glue joint profiles of different cutting widths. – PF 25 with profile depth 25 mm.
General information	– Simple and exact knife replacement. – No setting gauges required. – Constant profile/diameter (no correction to the machine settings required). – Ready for use immediately after knife replacement, even on the machine. – Basic clearance 0.5 mm without side clearance. – Exact fitting to the workpiece by height adjusting the position of the profile to the middle of the wood (profile symmetry = HD/2).

Positive and negative glue joint profile, combined in one tool

Profile cutterhead set - multi-purpose glue joint profile

Application:
For cutting longitudinal joints for dimensionally stable construction parts, windows and doors e.g. round arched joints, stairs and frame construction parts.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood, modified timber for window construction, compound materials of solid wood and wood derived material, uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Variable wood thickness (56/56/60/68/78/90/92/106/110 mm) through cutting processes in several passes (profile splitting).

ID **008271** = R 3

Profile cutterhead set ProfilCut Q - door processing

Application:
For profiling and rebating internal single rebate doors, rebate depth 15 mm.

Machine:
Stationary routers with/without CNC control, machining centres, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood, compound materials of solid wood and wood derived materials, uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Variable profile overlap by exchange profile edging knives.
Adjustable rebate dimensions: rebate width 22 mm, rebate depth 15 mm.
Seal groove profile by mounting grooving knives SB 4 mm. Constant tool diameter.

Profiles

Frame profiled on two sides - longitudinal profile

Profile cutterhead set ProfilCut Q - Door frame

Application:
For profiles and counter profiles in solid wood frame furniture doors.

Machine:
Stationary routers with/without CNC control, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood.

Technical information:
Tools with 5 profiles for double sided profiled frames and inserted or beaded panels. Additional tools available for changing from frames with profiles on both sides to frames with profiles on one side.

Frame profile two sides, 15 mm tongue
AG 341 2 53, SE 640 2 53

Tool Type	Tool no.	Z	V	n_{max} min^{-1}	ID

Profile cutter for Clamex® P system from Lamello

Application:
Router for milling the profile groove for Clamex® P system connectors from Lamello on nesting machines made by Holz-Her.

Machine:
Routing machines with CNC control, machining centres.

Workpiece material:
Chipboard and fibre materials (chipboard, MDF, HDF etc.), raw, plastic-coated, veneered etc., glued wood and laminated wood (plywood, Multiplex etc.).

Technical information:
Profile and basic cutting edges in PCD, boring edges in reversible knife design with diamond coating. For use exclusively on Holz-Her machines with existing software module (subject to licence). Not resharpenable.

Horizontal grooves (T-slots)

Vertical grooves

Diamaster tools for FixChip® connector system

Application:
Router cutters for milling horizontal and vertical grooves for FixChip® connectors on nesting machines.

Machine:
Routing machines with CNC control, machining centres.

Workpiece material:
Chipboard and fibre materials (chipboard, MDF, HDF etc.), raw, plastic-coated, veneered etc., glued wood and laminated wood (plywood, Multiplex etc.).

Technical information:
Profile, plunge and basic cutting edges in PCD. Cannot be resharpened due to accuracy of fit.

Working step/Application

Profiling (jointing, bevelling, rounding, panel raising and decorative grooves).

Workpiece material [recommended cutting material]

Softwood and hardwood [HS, HW].
Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. [HW].
Plywood [HW].
Duromers [HW].
Plastomers [HS, HW].
Solid surface material (Corian, Varicor etc.) [HW].
Decorative laminates (HPL-compact laminate, Trespa etc.) [HW].
Non-ferrous metal (Aluminium, copper etc.) [HS, HW].

Machine

Stationary routers with/without CNC control, CNC machining centres.
Milling machines with spindles to mount shank tools.

Operation

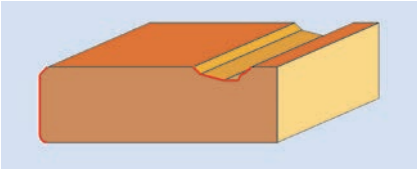

For conventional and climb cut operations.

Recommendation

Solid wood along grain: climb cut.
Solid wood across grain: conventional cut.

Technical features

Cutterhead with replaceable and shapeable knives or ProfilCut Q system cutterheads for machining panels and decorative grooves.

Example

Application parameters

RPM/feeds
Recommended cutting speeds v_C and chip load f_z for multi-purpose cutterheads.

	Cutterhead HS v_c [m/s]	**Cutterhead HW v_c [m/s]**
Softwood	50 – 80	60 – 90
Hardwood	40 – 60	50 – 80
Chipboard/MDF	–	60 – 80
Plywood	–	60 – 80
Plastic coated board	–	40 – 60

	Cutterhead HS/HW f_z [mm]
Solid wood along grain	0.3 – 0.5
Solid wood across grain	0.25 – 0.35
Chipboard/MDF	0.3 – 0.5
Plywood	0.25 – 0.35

Calculation formula: $v_f = f_z \cdot n \cdot Z / 1000$

Workpiece clamping

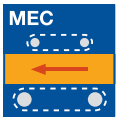

Sufficient workpiece clamping is very important on stationary machines.

Insufficient clamping can reduce both the cut quality and tool life considerably. Panels can be held in place with vacuum clamping, but sometimes additional mechanical clamping is required.

Small and arched workpieces in particular require special jigs or clamping devices which must be made by the customer or sourced from specialist suppliers.

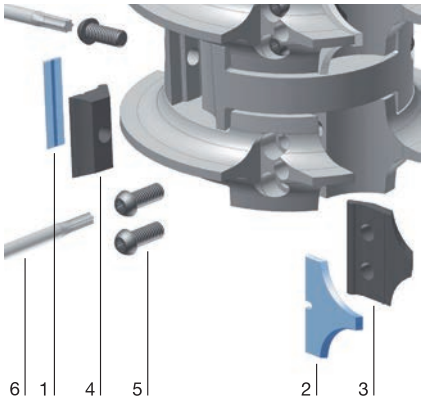

Profile cutterhead set ProfilCut Q

Application:
Multi-purpose tool set for bevelling and rounding, optional jointing of the workpiece edge.

Machine:
Stationary routers with/without CNC control, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood.

Technical information:
By combining jointing and bevelling or rounding cutterheads several different profiles and wood thicknesses can be covered. Different radii or bevel profile knives can be mounted in one cutterhead.

HW

Profile cutterhead - radii / bevel profile

Application:
For rounding workpieces with different radii or 45° bevelling.

Machine:
Stationary routers with/without CNC control, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), duromers, plastomers, solid surface material (Corian, Varicor etc.).

Technical information:
Multi-purpose use on top or bottom of workpiece up to HD approx. 35 mm. Suitable for cutting narrow internal radii on workpieces. One tool body can be used for radii from 2 to 5 mm and 45° bevels.

Cutterhead with set of radius profile knives

Profile examples

Multi-purpose profile cutterhead, Z 1

Application:
For cutting decorative grooves and internal profiles.

Machine:
Stationary routers with/without CNC-control, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Cutterhead with resharpenable profile knife. Form fit, play-free knife mounting by precise serration. Different profiles in one tool body. Special profiles can be ground into the blank knife on request and available with DP tipping for long performance time in wood derived materials.

For profiles, Z 1, cutting in end grain

HW

Profile area

Multi-purpose profile cutterhead, Z 2

Application:
For cutting decorative grooves, internal profiles and combined external and internal profiles.

Machine:
Stationary routers with/without CNC control, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Cutterhead with profiled changeable knives. One knife with centre cutting design. Knives with shear angle. Different profiles possible in one tool body. Special profiles ground into blank knives and backing plates on request. Use cutterhead WP 500 1 for smaller decorative groove profiles (d < 15 mm).

For profiles, Z 2, cutting in end grain

Working step/Application	Profiling.
Workpiece material [recommended cutting material]	Softwood and hardwood [HS, HW]. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. [HW, DP]. Plywood [HW, DP]. Duromers [HW, DP]. Plastomers [HS, HW, DP]. Solid surface material (Corian, Varicor etc.) [HW, DP]. Decorative laminates (HPL-compact laminate, Trespa etc.) [HW, DP]. Non-ferrous metal (Aluminium, copper etc.) [HS, HW, DP].
Machine	Stationary routers with/without CNC control. Milling machines with spindles to mount shank tools.
Operation	For conventional and climb cut operations, limited chip removal.
Technical features	Profile shank cutters can be produced for the following profiles:

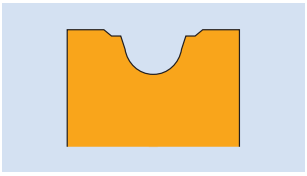

Bevelling

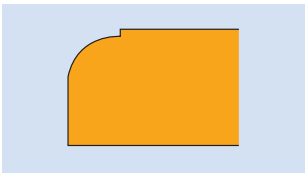

Panel raising

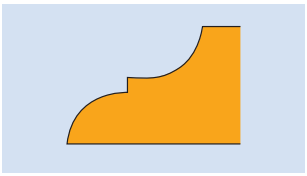

Edges with radii

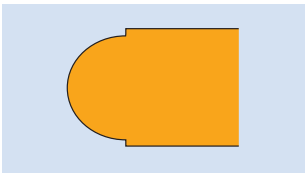

Decorative grooves

Quarter round

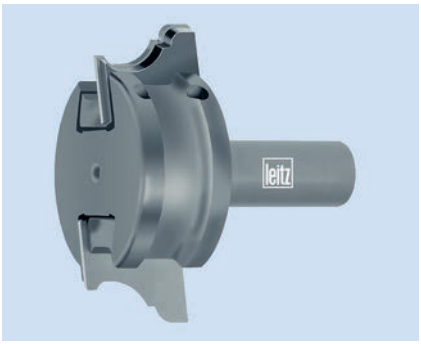

Other special profiles

Half round

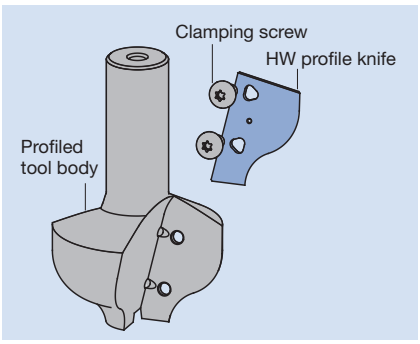

VariForm	Profile cutterhead with shank for blank knives on profiled tool body or blank knives with backing plates

VariForm profile cutterhead with blank knives and backing plates

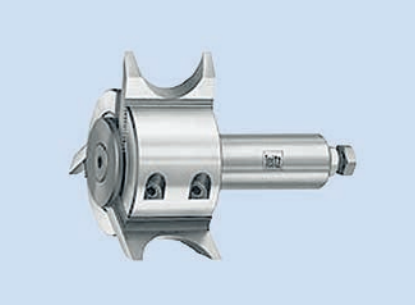

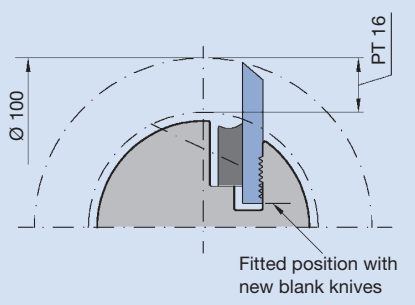

VariForm profile cutterhead with profiled tool body.

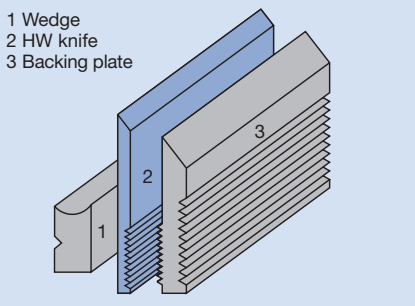

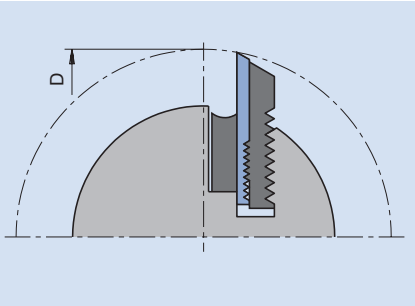

Profiling of the knives, backing plates and tool body by Leitz service.

Profile cutterhead with shank for serrated back blank knives

Existing profile cutterheads can use the Micro-system set.

Tipped profile shank cutter

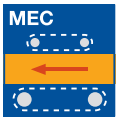

Tipped profile shank cutters can be supplied in various designs.
Available with HS, HW and DP cutting materials and produced to customer requirements.
Designs with Z 1 - Z 5, with or without shear angle, Z 1/1 - Z 3/3 with alternate shear angles and with or without plunging tip.
Further information available from your nearest Leitz subsidiary or agency.

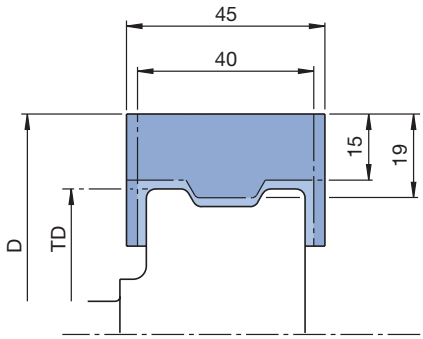

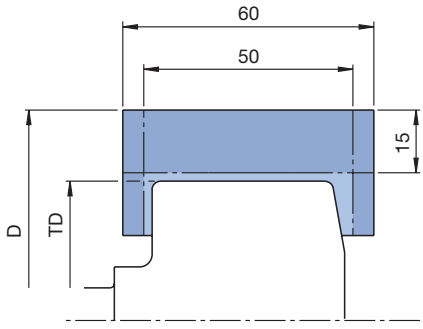

Profile area

Profile cutterhead VariForm with backing plates

Application:
For cutting different profiles. Profile can be changed by replacing profile knives and backing plates.

Machine:
Stationary routers with/without CNC control, milling machines with spindles to mount shank tools.

Workpiece material:
Softwood and hardwood (HW-30F), chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.) (HW-10F).

Technical information:
Three point knife clamping for high precision and safety. Economic, resharpenable 3 to 4 times. Modular system: use the same profile knives in different tool bodies on different machines.

Working step/Application	Sizing, jointing, grooving and profiling.
Workpiece material [recommended cutting material]	Softwood and hardwood [HS, HW]. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. [HW]. Plywood [HW]. Duromers [HW, DP]. Plastomers [HS, HW]. Solid surface material (Corian, Varicor etc.) [HW]. Composite panels (Alucobond®, Dibond® etc.) [HW].
Machine	Portable routers
Operation	Conventional cut, limited chip removal.
Technical features	Tools for portable routers are: Straight routers: HS solid HW tipped HW solid HW turnblade DP tipped (Only for special applications with known workpieces). Profile routers: HW tipped DP tipped (Only for special applications with known workpieces).
Application parameters	**RPM** Recommended RPM for routing and boring tools on portable router machines:

	Recommended RPM n [min^{-1}]
Dowel drill	3000 – 9000
Hinge drill	3000 – 9000
Router cutter with cylindrical shank	18000 – 30000
Router cutter with internally thread shank	16000 – 24000
Turnblade router cutter WL 101 1	16000 – 18000
Profile cutters HW tipped	18000 – 27000

The RPM speeds marked on the shank are mandatory.

Feed	The manual feed speed of portable routers depends on the required cut quality and machine load. To ensure proper intended use of portable router bits it is only allowed to machine in conventional cut. Climb cut is not permissible.
Machining method	Portable routers are usually used either with guide bearings or templates when producing components in batches. Router cutters with guide bearings are suitable for additional machining operations on part finished components. Tools without guide bearings are generally used with either a side stop or a guide rail system.

Grooving cutters, shank 8 mm

Application:
Router cutter for sizing and grooving.

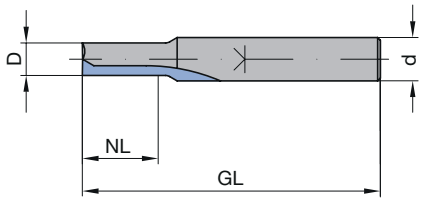

Machine:
Portable routers.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

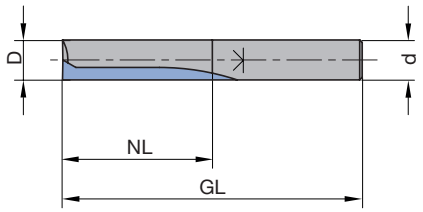

Technical information:
Straight cut, ground on end or with tungsten carbide plunging tip.

HW

Turnblade router cutter

Application:
Router cutter for sizing and grooving to finish quality.

Machine:
Portable routers, limited suitable: stationary routers with/without CNC control, machining centres.

Workpiece material:
Softwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc.

Technical information:
Tungsten carbide turnblade knife clamped by wedge. Design without plunging tip only suitable for ramp plunging. Design with plunging tip limited suitable for axial plunging.

HW, Z 1, with plunging tip

V-groove cutter for plasterboard

Application:
Router for cutting V-grooves in plasterboard for folding.

Machine:
Portable routers.

Workpiece material:
Plasterboard and gypsum fibre, softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Cutting edges with shear angle, flat point designed for folding.

Production of folding corners on composite panels

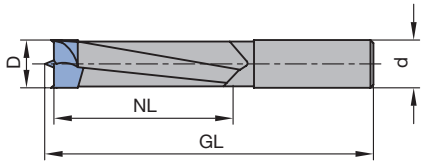

HW

Dowel drill Z 2 / V 2

Dowel drill, HW, Z 2 / V 2

Application:
For drilling blind holes, particularly dowel holes in furniture construction.

Machine:
Portable routers.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Spurs geometry with shear cut. Tool body with reduced diameter for minimum friction and feed force. Cylindrical shank without clamping flat.

Problem	Possible cause	Action
Chatter marks Loud cutting noise	– Wrong removal rate	Adjust feed speed and RPM for cutting depth to the chart on the product page. If necessary, machine the cutting depth in 2 steps or precut with roughing router cutter.
	– Incorrectly adjusted tool dimensions	Use a more solid tool with largest possible shank and tool diameters and short working length. Select tool with staggered or spiral cutting edges.
	– Vibrations of the tool spindle system	Note minimum shank clamping length. $l_{e\ min}$ = 2 x shank diameter. Do not machine with long or secondary chucks. Use short chunks (PM 320 0 53) or shrink clamping devices. Check and, if necessary, repair machine guides and motor bearings.
	– Insufficient clamping of workpiece	Increase vacuum clamping. Clamp waste. Improve workpiece clamping by mechanical clamping, friction or fastening with screws.
Marks on the workpiece from tools with staggered cutting edges **Note:** Tools with staggered cutting edges cannot produce surfaces free of marks due to minor tolerances in concentricity. In MDF and solid wood, concentricity inaccuracies of 0.03 mm are visible.	– Errors in concentric running of clamping chuck, motor spindle or tool	To identify cause, turn tool 90° in the chuck and cut again: A change in the marks on the workpiece point to chuck error. Most accurate concentricity is achieved using hydro chucks or shrink chucks. Constant cutter marks point to a defective tool which should be repaired or exchanged.
	– Unstable spindle bearing	Select short chucks. Do not use extension pieces.
Tool breakage of shank cutters	– Cutting depth or feed speed too high	Adjust application data to chart on the product page.
	– Wrong tool clamping	Note minimum shank clamping length. $l_{e\ min}$ = 2 x shank diameter. Do not machine with long or extension chunks. Use short chucks (PM 320 0 53) or shrink-clamping chucks.
	– Incorrectly adjusted tool dimensions	Use a more solid tool with the largest possible shank and tool diameters and shortest working length. Select tool with staggered or spiral cutting edges.
	– Inadequate tool clamping (critical with solid HW tools)	Check chuck clamping area for burrs or dirt.
	– Damage from loose waste pieces	Clamp waste pieces. Hog small pieces when shaping.
	– Machine vibrations	Check machine guide and motor bearings. Check balance of clamping chuck.
Cutting edge breakages on DP (DIA) router bits	– Vibrations of tool spindle	Check balance, contamination and concentricity of the clamping chuck.
	– Vibrations at the workpiece due to insufficient support	Clamp tool as close as possible to the profile. Make vacuum clamping areas as large as possible. Clamp waste pieces.

Continuous wear of cutting edges
Mechanical abrasion causes continuous wear of the cutting edge when machining largely uniform materials.

The degree of permissible wear is determined by the required machined quality. As a standard the width of wear VB of 0.2 up to maximum 0.3 mm should not be exceeded.

Tipped tools must be resharpened in good time to ensure the economic efficiency of the tool.

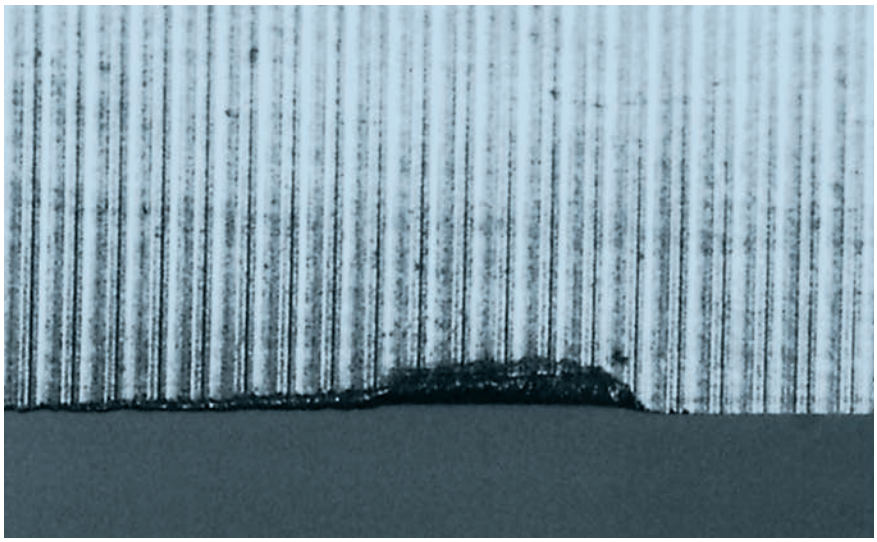

Normal cutting edge wear after machining of spruce.

Local cutting edge wear
Irregular cutting edge wear is caused when machining non-uniform panel materials (e.g. coated chipboard or laminate floors).

The highest abrasion occurs in the area of more densely pressed surface layers with higher sand content. This local abrasion defines the quality of the machined edge and determines the end of the tool life.

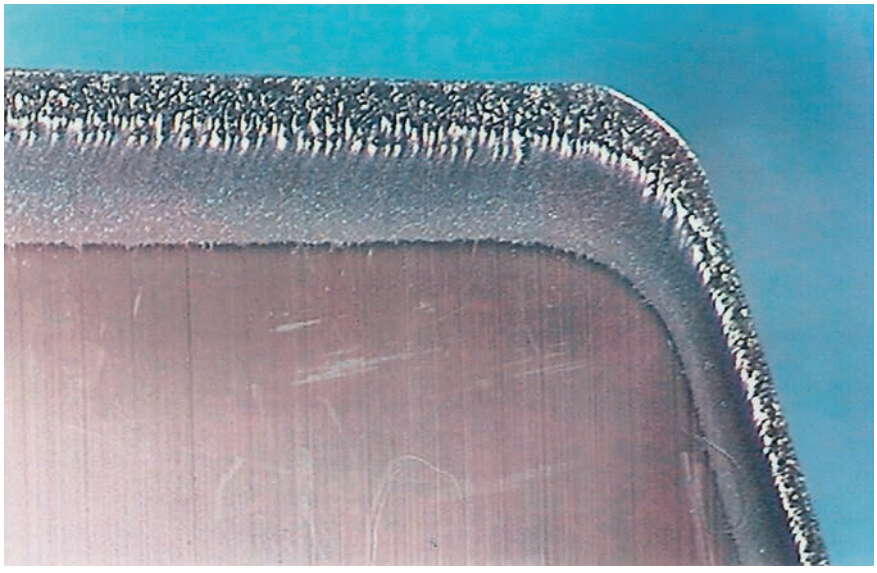

If the machining situation allows axial adjustment tool, a sharp section of cutting edge can be used to machine the edge, increasing the tool performance time.

Cutting edge wear after machining chipboard.

Chemical abrasion
When machining materials with a high tannic acid content (e.g. oak) the cutting edge is subject to chemical abrasion in addition to mechanical abrasion.

The cobalt binder material in the tungsten carbide is etched away through chemical abrasion, damaging the cutting material.

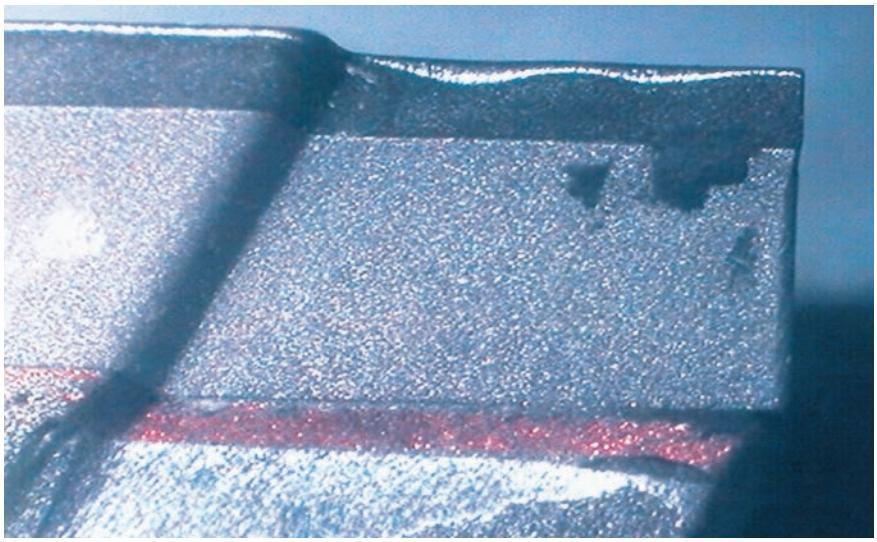

Chemical influence – cutting edge wear – after machining of oak.

Cutting edge wear
Mechanical abrasion causes continuous wear of the cutting edge when machining largely uniform materials.

The degree of the permissible wear is determined by the required machined quality. As a standard the width of wear VB of 0.2 up to maximum 0.3 mm should not be exceeded.

Because of the long performance time, resin can build up on cutting edges.

Performance time can be increased by regular cleaning.

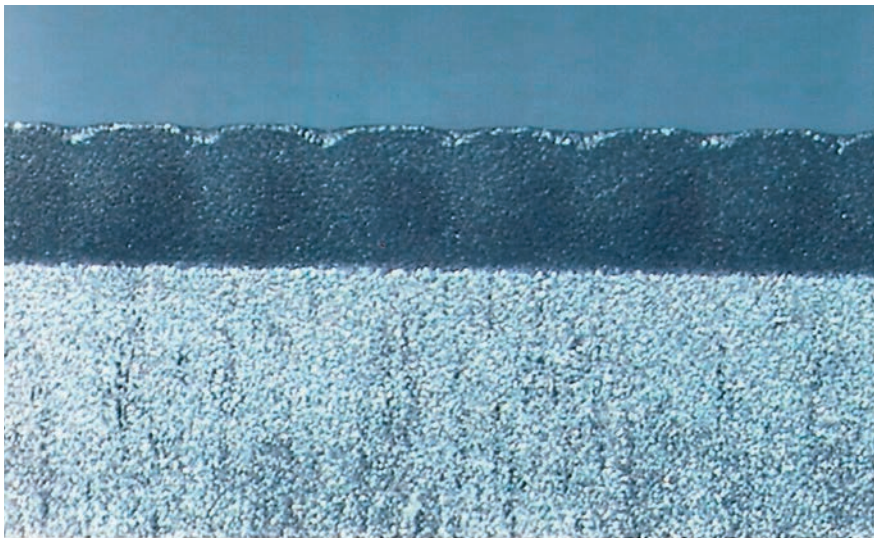

Cutting edge wear after machining GFK.

Cutting edge wear and small fractures
When machining some wood derived and composite materials the cutting edge is damaged by small fractures as well as the usual wear.

This is usually caused by hard mineral particles in the workpiece material.

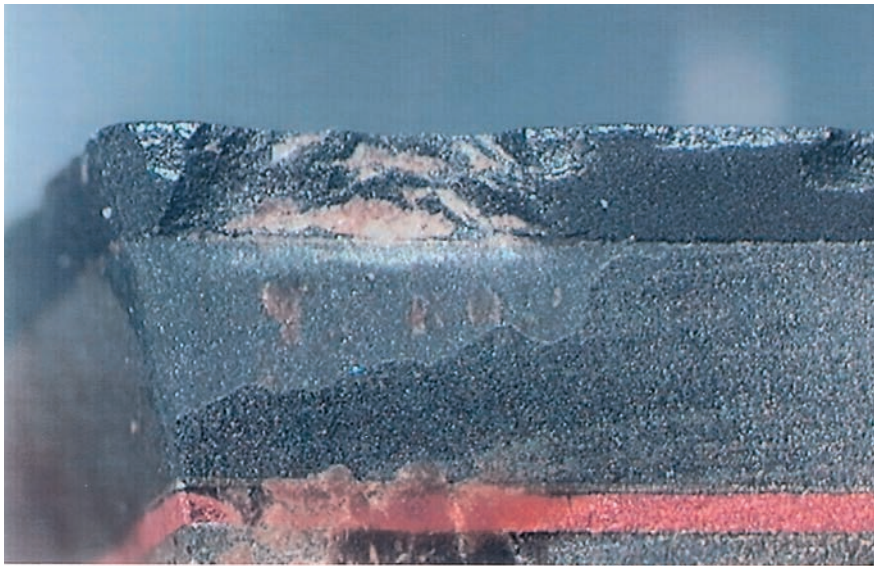

Fractures at the cutting edge can also be caused by high frequency machine vibrations. Imbalanced tools and chucks, worn spindles or machining close to a resonant RPM may cause such vibrations.

Cutting edge wear and fractures after machining HPL/CPL.

Cutting edge destruction
The cutting edge can be destroyed when machining non-uniform materials containing mineral or metallic particles.

These particles cannot be detected prior to machining and limit the use of DP tools for machining such materials.

Cutting edge destruction by metallic particles embedded in the workpiece.

Explanation of abbreviations

A	=	dimension A
a_e	=	cutting thickness (radial)
a_p	=	cutting depth (axial)
ABM	=	dimension
APL	=	panel raising length
APT	=	panel raising depth
AL	=	working length
AM	=	number of knives
AS	=	anti sound (low noise design)
b	=	overhang
B	=	width
BDD	=	thickness of shoulder
BEM	=	note
BEZ	=	description
BH	=	tipping height
BO	=	bore diameter
CNC	=	Computerized Numerical Control
d	=	diameter
D	=	cutting circle diameter
D0	=	zero diameter
DA	=	outside Diameter
DB	=	diameter of shoulder
DFC	=	Dust Flow Control (optimised chip clearance)
DGL	=	number of links
DIK	=	thickness
DKN	=	double keyway
DP	=	polycrystalline diamond
DRI	=	rotation
FAB	=	width of rebate
FAT	=	depth of rebate
FAW	=	bevel angle
FLD	=	flange diameter
f_z	=	tooth feed
$f_{z\ eff}$	=	effective tooth feed
GEW	=	thread
GL	=	total length
GS	=	Plunging edge
H	=	height
HC	=	tungsten carbide, coated
HD	=	wood thickness (thickness of workpiece)
HL	=	high-alloyed tool steel
HS	=	high-speed steel (HSS)
HW	=	tungsten carbide (TCT)
ID	=	ident number
IV	=	insulation glazing
KBZ	=	abbreviation
KLH	=	clamping height
KM	=	edge breaker
KN	=	single keyway
KNL	=	combination pinhole consists of 2/7/42 2/9/46,35 2/10/60
L	=	length
l	=	clamping length
LD	=	left hand twist
LEN	=	Leitz standard profiles
LH	=	left hand rotation
M	=	metric thread
MBM	=	minimum order quantity
MC	=	multi-purpose steel, coated
MD	=	thickness of knife
min^{-1}	=	revolutions per minute (RPM)
MK	=	morse taper
m min^{-1}	=	metres per minute
m s^{-1}	=	metres per second
n	=	RPM
$n_{max.}$	=	maximum permissible RPM
NAL	=	position of hub
ND	=	thickness of hub
NH	=	zero height
NL	=	cutting length
NLA	=	pinhole dimensions
NT	=	grooving depth
P	=	profile
POS	=	cutter position
PT	=	profile depth
PG	=	profile group
QAL	=	cutting material quality
R	=	radius
RD	=	right hand twist
RH	=	right hand rotation
RP	=	radius of cutter
S	=	shank dimension
SB	=	cutting width
SET	=	set
SLB	=	slotting width
SLL	=	slotting length
SLT	=	slotting depth
SP	=	tool steel
ST	=	Cobalt-basis cast alloys, e.g. Stellite™
STO	=	shank tolerance
SW	=	cutting angle
TD	=	diameter of tool body
TDI	=	thickness of tool
TG	=	pitch
TK	=	reference diameter
UT	=	cutting edges with irregular pitch
V	=	number of spurs
v_c	=	cutting speed
v_f	=	feed speed
VE	=	packing unit
VSB	=	adjustment range
WSS	=	workpiece material
Z	=	number of teeth
ZA	=	number of fingers
ZF	=	tooth shape (cutting edge shape)
ZL	=	finger length

Notes to the Lexicon concerning the diagrams and tables

The statements made in the diagrams and tables relate to specific conditions and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

Signs of wear 53

Enquiry/order form special tools – drilling 54

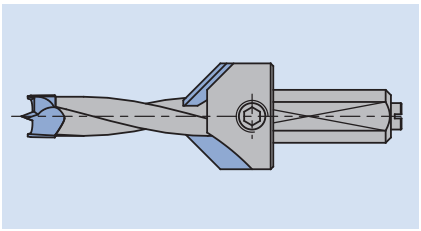

Alphabetical product index 56

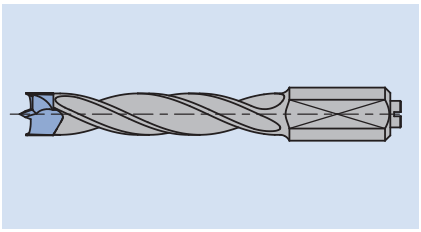

ID index 57

Application	To drill tear-free dowel holes and blind holes.
Workpiece material	Softwood and hardwood. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. Laminated veneer lumber (plywood, multiplex plywood, glued lumber etc.). Plastomers.
Machine	Through feed drilling machines, Point-to-point drilling machines, CNC Machining centres, Hinge boring machines, Special purpose drilling machines.
Design	Two dowel drill designs available:

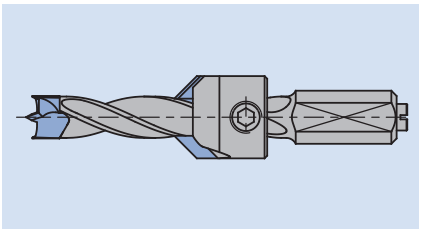

1. Design without heel
Optimised dowel drill for machining panels in the furniture industry.
Minimum friction and feed forces as the flute has a smaller diameter.
A loose countersink can be clamped on the shank.

2. Design with heel
Dowel drills with heel are used to drill holes in solid wood and for machines with insufficient guidance during drilling and return stroke. The drill has better guidance during the return stroke to prevent tear-outs at the edge.
A loose countersink can be clamped on the heel and allows adjustment of the drilling and countersink depth.

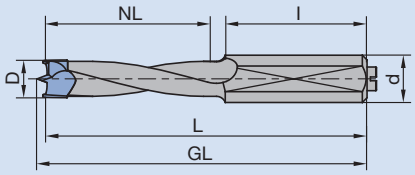

Shank	Dowel drills usually have a shank diameter d = 10 mm. Drilling machines with only a small pitch between the drilling spindles may use dowel drills with a shank diameter d = 8 mm. Additionally, it is possible to mount the dowel drills directly on the drilling spindles with a threaded adaptor. Adaptors are available with different combinations of threads and either cylindrical or tapered seatings. Special shank dimensions available on request.

Technical features

The dimensions listed in the tool tables refer to the following tool parameters:

D	Drill diameter
d	Shank diameter
l	Shank length
NL	Working length = possible drilling depth
GL	Total length of the drill including the projection of the centre point
L	Total length of the drill excluding the projection of the centre point

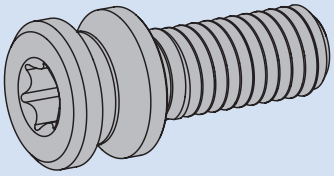

Application data

RPM/feed speeds
The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables. Identification of the rotation: RH - black; LH - red.

Information

The existing allen screws in the shanks must be replaced by the length setting screw ID **009157** when using dowel drills in Leitz quick-change drill adaptors.

Length setting screw ID **009157** for quick-change clamping adaptor

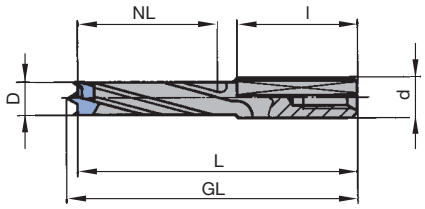

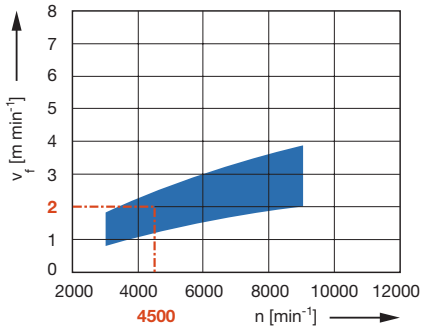

HW

Correction factor for v_f:
Veneered = 0.8
Paper coated = 0.8
MDF, solid wood = 0.7
Chipboard, uncoated = 1.3

Shank 8 mm

Application:
For drilling blind holes, particularly dowel holes in furniture construction. Recommended on drill spindles with limited rigidity.

Machine:
Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Spur geometry with shear cut. Drills can be combined with countersink WB 701 0 03. Countersink fixed on heel. Continuously adjustable boring and countersink depth. Good guidance on return stroke for tear-free holes.

6.2 Through hole drilling

Application

To drill tear-free through holes in panels.

Workpiece material

Softwood and hardwood.
Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc.
Laminated veneer lumber (plywood, multiplex plywood, glued lumber etc.).
Plastomers.

Machine

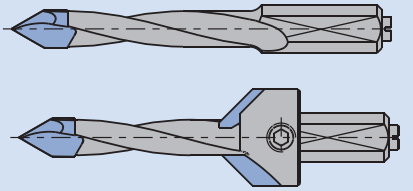

Through feed drilling machines,
Point-to-point drilling machines,
CNC machining centres,
Hinge boring machines,
Special purpose drilling machines.

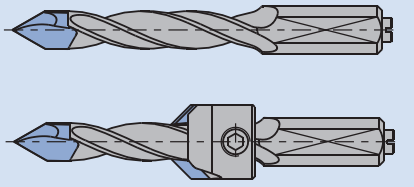

Design

Two available through hole drill designs:

1. Design without heel
Optimised through hole drill for machining panels in the furniture industry. Minimum friction and feed forces as the flute has a smaller diameter. A loose countersink can be clamped on the shank.

2. Design with heel
Through hole drills with heel are used to drill holes in solid wood and for machines with insufficient guidance during drilling and return stroke. The drill has better guidance during the return stroke to prevent tear-outs at the edge. A loose countersink can be clamped on the heel and allows adjustment of the drilling and countersink depth.

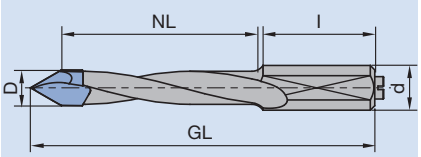

1

2

Shank

Through hole drills usually have a shank diameter d = 10 mm. Drilling machines with a small pitch between the drilling spindles may use drills with a shank diameter d = 8 mm.

Technical features

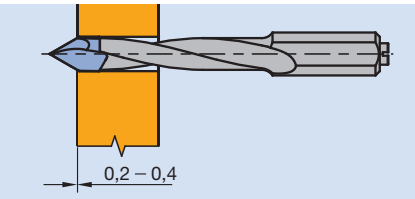

The dimensions listed in the tool tables refer to the following tool parameters:

D	Drill diameter
d	Shank diameter
l	Shank length
NL	Working length = possible drilling depth
GL	Total length of the drill

Application data

RPM/feed rates
The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables.
Identification of rotation: RH - black; LH - red.

Application recommendation

The drilling quality in brittle or low-adhesive surfaces can be improved when the feed speed is reduced as the drill breaks through the workpiece.

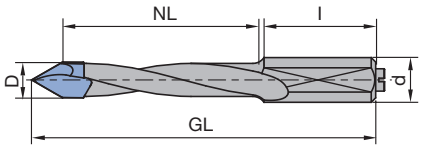

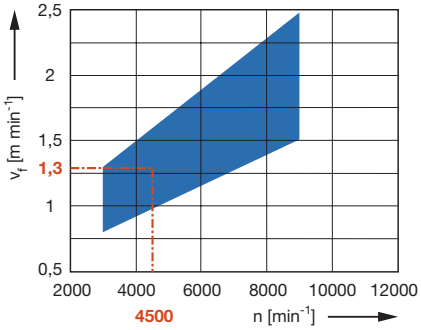

HW

Design without heel

Feed speed v_f depending on the spindle RPM n

Workpiece material:
Chipboard plastic coated
Operation:
Drilling
Correction factor for v_f:
Veneered = 0.8
MDF = 0.7
Chipboard, uncoated = 1.3

Shank 10 mm

Application:
For drilling through holes, particularly in furniture construction.

Machine:
Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), elastomers.

Technical information:
Drills can be combined with countersink WB 701 0 02. Countersinks can be clamped on the shank. Recessed flute for minimised friction and feed forces.

HW

Design with heel

Feed speed v_f depending on the spindle RPM n

Workpiece material:
Chipboard plastic coated
Operation:
Drilling
Correction factor for v_f:
Veneered = 0.8
MDF = 0.7
Chipboard, uncoated = 1.3

Shank 10 mm

Application:
For drilling through holes, particularly in furniture construction. Recommended on drill spindles with limited rigidity

Machine:
Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), elastomers.

Technical information:
Drills can be combined with countersink WB 701 0 03. Countersinks fixed on heel. Continuously adjustable boring and countersink depth. Good guidance on return stroke for tear-free holes.

HW

Design without heel

Feed speed v_f depending on the spindle RPM n

Workpiece material:
Chipboard plastic coated
Operation:
Drilling
Correction factor for v_f:
Veneered = 0.8
MDF, solid wood = 0.7
Chipboard, uncoated = 1.3

Shank 10 mm, HW tipped

Application:
For drilling tear-free through holes, particularly in furniture construction, with maximised quality on the bottom side (exit).

Machine:
Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
V-point tip with 2 bevels for maximised quality on the bottom side (exit). High wear resistant tungsten carbide grade for maximum lifetime. Drills can be combined with countersink WB 701 0 02. Countersinks can be clamped on the shank. Recessed flute for minimised friction and feed forces.

DP

WB 100 0 50

Feed speed v_f depending on the spindle RPM n

Workpiece material:
Chipboard plastic coated
Operation:
Drilling
Correction factor for v_f:
MDF = 0.7
Chipboard, uncoated = 1.2

Shank 10 mm

Application:
For drilling tear-free through holes. Particularly suitable for drilling panel materials with abrasive components (fire proof material etc.).

Machine:
Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:
Gypsum bonded particle and fibre materials, cement bonded particle and fibre materials, flame resistant particle and fibre materials, solid resin glulam, fibre reinforced plastics.

Technical information:
DP tipped through hole boring bit for maximum lifetime, particularly in abrasive materials. Large gullet for optimum chip removal.

6.3 Hinge drilling

Application	To drill tear-free hinge holes.
Workpiece material	Softwood and hardwood. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. Laminated veneer lumber (plywood, multiplex plywood etc.).
Machine	Through feed drilling machines, Point-to-point drilling machines, CNC machining centres, Hinge boring machines, Special purpose drilling machines.
Design	Two available hinge drill designs:

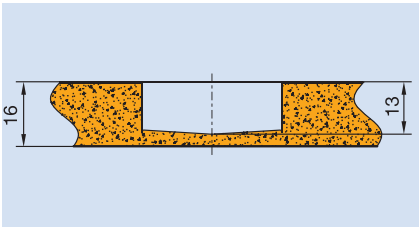

1

1. Design with centre point,
2 spurs and 2 spiral cutting edges (Z 2/V 2). These drills are optimised for machining standard panels in the furniture industry.
Design with short tip for deep holes in thin panels.

2

2. Design without centre point,
3 spurs and 3 spiral cutting edges ground to a V point (Z 3/V 3). Recommended when there is the risk of the centre point marking or breaking through the back of the panel, e.g. when drilling a 13 mm deep hole in a 16 mm thick workpiece.

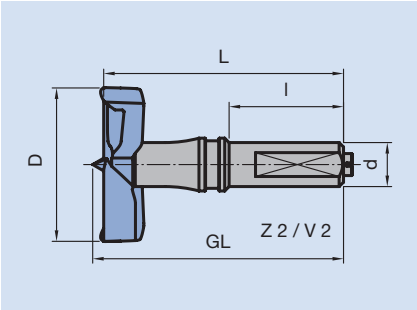

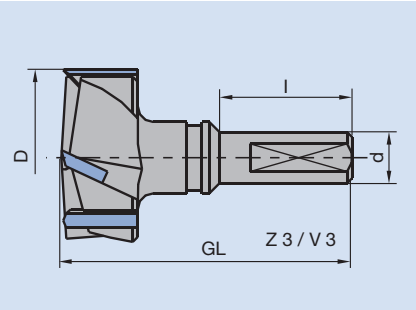

Shank	Hinge drills usually have a shank diameter of d = 10 mm.

Technical features

The dimensions listed in the tool tables refer to the following tool parameters:

D	Drill diameter
d	Shank diameter
l	Shank length
L	Total length of the hinge drill excluding the projection of the centre point
GL	Total length of the hinge drill including the projection of the centre point

Application data

RPM feed speeds

The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables.

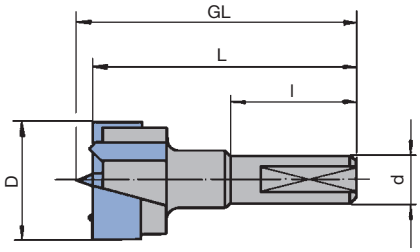

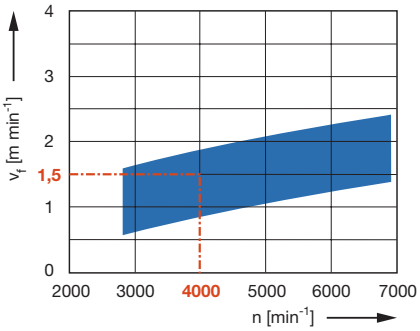

HW

Z 2 / V 2 with centre point

Feed speed v_f depending on the spindle RPM n

Workpiece material:
Chipboard plastic coated
Operation:
Drilling
Correction factor for v_f:
Veneered = 0.8
Paper coated = 0.8
MDF, solid wood = 0.7

Shank 10 mm

Application:
For drilling hinge holes, particularly in furniture construction.

Machine:
Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
Good centering in solid wood by protruding centre point.

HW

Double hinge drill with pre-drill

Double hinge drills in aggregate

Shank 10 mm, double furniture hinge

Application:
For drilling hinges and pivots in window manufacturing in single or twin drill design.

Machine:
Stationary routers with/without CNC control, machining centres, special cutting machines to machine frame parts, drilling machines, multi spindle units.

Workpiece material:
Softwood and hardwood, modified timber for window construction, laminated veneer lumber (plywood, multiplex plywood etc.), glued lumber.

Technical information:
Round spur geometry for high edge quality. Solid tungsten carbide design (ID **037218** / **037219** TC-tipped). High wear resistant tungsten carbide grade. Minimum distance of drill spindle 22 mm. ID **037218** / **037219** with pre-drill for corner pivots with pilot pin.

Boring bit set, consisting of 1 pc. RH and LH

DP

Feed speed v_f depending on the spindle RPM n

Workpiece material:
Chipboard plastic coated
Operation:
Drilling
Correction factor for v_f:
Veneered = 0.8
Paper coated = 0.8
MDF = 0.7

Shank 10 mm

Application:
For drilling hinge holes, particularly in furniture construction with maximum durability. Specially for drilling materials with hard and abrasive coatings (e.g. HPL, CPL etc.).

Machine:
Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units.

Workpiece material:
Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., fire resistant particle and fibre materials, laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
DP tipped for increased performance time compared to tungsten carbide. Suitability for high volume production. Diamaster PRO tipping, resharpenable two/three times with normal wear. Preferred used on automatic machines. Drills can only be used in column drilling machines when workpieces are clamped tightly.

Application

To drill holes for the furniture industry and in timber frame construction.

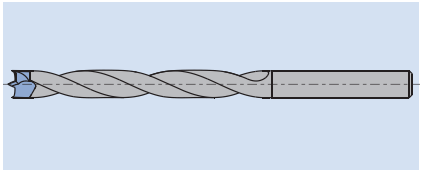

Workpiece material [recommended cutting material]

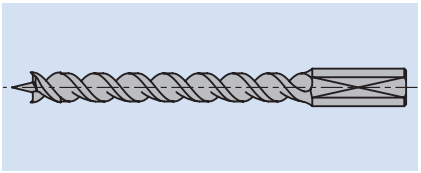

Softwood and hardwood.
Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. [only HW].
Laminated veneer lumber (plywood, multiplex plywood etc.) [only HW].

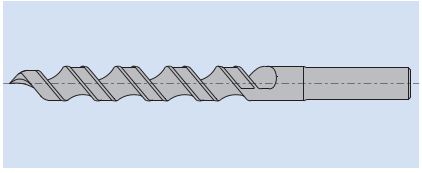

Machine

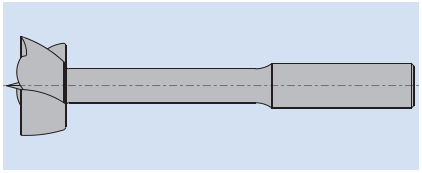

Column drilling machines,
Drilling machines,
Special purpose drilling machines,
Portable drills.

Design

1. Twist drills
Twist drills with a centre point and spurs (Z 2/V 2) are used to drill holes deeper than possible with dowel drills.
There is a choice of cutting materials – SP, HS and HW. The matrix shows the recommended cutting material for the different workpiece materials:

	SP	HS	HW
Softwood, dry	♦	♦	♦
Softwood, wet	♦	♦	◇
Hardwood, dry	◇	♦	♦
Hardwood, wet	◇	♦	◇
Laminated wood (plywood, etc.)			♦
Chipboard and fibre materials			
- paper coated			♦
- plastic coated			♦
- veneered			♦
Solid wood, veneered			♦

♦ suitable ◇ partly suitable

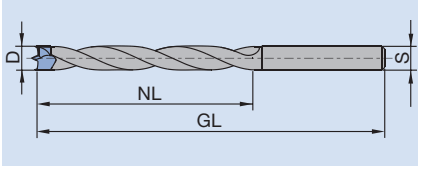

Tungsten carbide spiral drills are available with single or double heel. The design with double heel improves guidance during boring and return stroke and reduces the friction between flute and hole.
Solid tungsten carbide Z 2/V 2 design suitable for drilling deep holes in solid wood without interim clearance strokes and for high feed speeds.

Twist drill WB 121 0 32 with special cutting edge geometry for drill holes in HPL without break-outs on both sides.

2. Levin type drill
Levin type drills are used to drill deep holes. The key feature is a spiral flute with a large chip gullet cross section giving excellent chip clearance. With V point in HS, recommended for through hole drilling and drilling holes in end grain.

3. Cylinder head drills
Cylinder head drills are used to drill tear-free holes in solid wood, for blind holes, for hinge holes and holes for repair plugs.

Technical features

The dimensions listed in the tool tables refer to the following tool parameters:

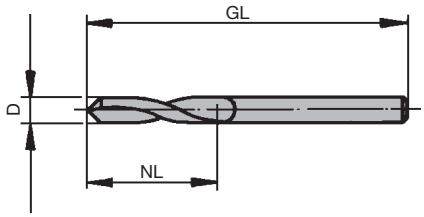

D	Drill diameter
S	Shank diameter x shank length
NL	Working length = possible drilling depth
GL	Total length of the drill including the projection of the centre point

Application data

RPM/feed speeds
The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables.

HW solid, Z 2

Application:
For multi-purpose drilling of blind and through holes.

Machine:
Point-to-point drilling machines, through feed drilling machines, CNC machining centres, hinge boring machines, multi spindle units, column drilling machines, portable drills.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), plastics (thermoplastic, fibre reinforced etc.), NF-metals (aluminium, copper etc.).

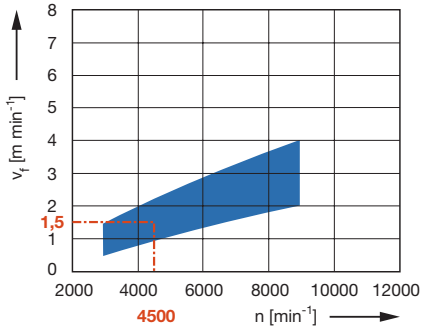

Technical information:
Flat V-point. Shank diameter identical to drill diameter. Convert for shank D 10 mm with reducing sleeve TB 110 0 or PM 320 0 25 (see following pages). Drilling in NF-metal requires suitable lubrication (spray mist or minimal lubrication).

Feed speed v_f depending on the spindle RPM n

Diameter:
D = 6 - 12 mm
Workpiece material:
Softwood
Operation:
Drilling
Correction factor for v_f:
Hardwood = 0.8
Laminated veneer lumber = 1.2

Diameter:
D > 12 mm
Workpiece material:
Softwood
Operation:
Drilling
Correction factor for v_f:
Hardwood = 0.8
Laminated veneer lumber = 1.2

Optionally with triangular shank, for mounting in drill chucks

HS-twist drill XL, Z 2 / V 2

Application:
For drilling very deep through holes without interim clearance strokes.

Machine:
Joinery machines, column drilling machines, drilling machines, multi spindle units, special purpose drilling machines, portable drills.

Workpiece material:
Softwood and hardwood.

Technical information:
Design in HS solid, Z 2 / V 2 with long centre point. Polished gullets for perfect chip removal. Extra-long centre point for use of the drills at an angle.

HW

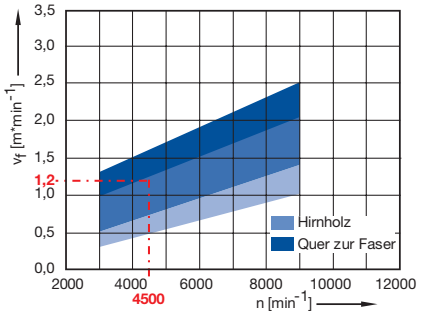

WB 101 0 13, twist drill with V-point

WB 101 0 13, twist drill with V-point, with adaptor

Feed speed v_f depending on the spindle RPM n

Workpiece material:
Softwood
Operation:
Drilling
Correction factor for v_f:
Hardwood = 0.8
Laminated veneer lumber = 1.1

HW solid, Z 2, V-point

Application:
For drilling deep holes. Particularly for timber frame and window construction.

Machine:
Stationary routers with/without CNC control, machining centres, special cutting machines to machine frame parts, column drilling machines, drilling machines, multi spindle units, portable drills.

Workpiece material:
Softwood and hardwood, modified timber for window construction, laminated veneer lumber (plywood, multiplex etc.), glued lumber.

Technical information:
Solid tungsten carbide design, Z 2 with V-point. Design with double heel for improved guidance while drilling and return stroke from the hole. Shank design with reduced clamping area for good centering in shrink and collet chucks.

Application	Countersink of holes.
Workpiece material [recommended cutting material]	Softwood and hardwood. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. [only HW]. Laminated veneer lumber (plywood, multiplex plywood etc.) [only HW]. Plastomers [only HW]. Duromers [only HW]. Solid surface material (Corian, Varicor, Noblan, etc.) [only HW]. Decorative laminates (HPL-compact laminate, Trespa etc.) [only HW]. Compound materials [only HW]. Non-ferrous metals [only HW].
Machine	Through feed drilling machines, Point-to-point drilling machines, CNC machining centres, Column drilling machines, Drilling machines, Special purpose drilling machines, Portable drills.
Design	**1. Loose countersink for mounting on dowel drills.** The loose countersink is clamped on the shank or heel (for dowel drills or through hole drills with heel). It allows drilling and countersinking in one operation. It is possible to clamp and adjust the loose countersink on the heel of drills with heel.

2. Loose countersink for mounting on twist drills.
Countersink with a countersink angle of 90° or 180° can be clamped on twist drills.

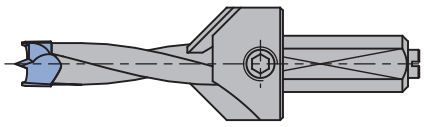

3. Single part countersink.
Single part countersinks are used for subsequent countersinking of holes. Nearly all materials can be countersunk with tungsten carbide design. Usually this countersink is used to countersink holes for flush screws.

SP

HW

WB 700 0 countersink 90° SP, Z1

WB 702 0 countersink 90° solid tungsten carbide, Z 3

Shank 10 mm

Application:
For the additonal countersinking of holes.

Machine:
Multi spindle units, column drilling machines, portable drills.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.), plastics (thermoplastic, fibre reinforced etc.), NF-metals (aluminium, copper etc.).

Technical information:
Countersink 90° Z 1 solid SP (only for softwood and hardwood).
Countersink 90° Z 3 solid tungsten carbide. Special grinded section for clean and chatter-free cut.

Countersink 90°
WB 700 0, WB 702 0

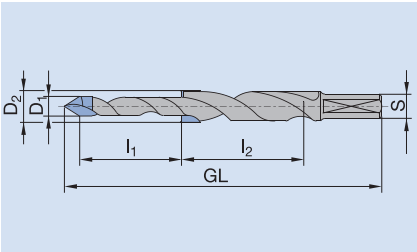

D	GL	S	QAL	DRI	ID
mm	mm	mm			
16	75	10x50	SP	RH	**036220** ●
20,5	58	10x40	HW solid	RH	**036255** ●

RPM: n = 2500 - 6000 min^{-1}

The illustrations shows the smallest and largest hole diameters possible, countersunk with a 1x45° bevel:
Countersink 90° SP:
d_{min} = 4.00 mm, d_{max} = 12.00 mm

Countersink 90° HW:
d_{min} = 2.00 mm, d_{max} = 18.00 mm

Application	To drill stepped holes.
Workpiece material	Softwood and hardwood. Chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc. Laminated veneer lumber (plywood, multiplex plywood etc.). Plastomers. Duromers. Solid surface material (Corian, Varicor, Noblan etc.). Compound materials. Non-ferrous metals.
Machine	Through feed drilling machines, Point-to-point drilling machines, CNC machining centres, Column drilling machines, Drilling machines, Special purpose drilling machines, Portable drills.
Design	Step drills are characterized by two drilling operations. The first drill can have either a V point or a centre point with spurs. The second operation can have either a flat 180° counterbore or an angled countersink < 180°.
Technical features	The dimensions listed in the tool tables refer to the following tool parameters:

D_1	Diameter, pre-drill
D_2	Diameter, first step
l_1	Working length pre-drill
l_2	Working length, first step
S	Shank diameter x shank length
GL	Total length of the drill bit including the projection to the centre point

Application data	**RPM/feed speeds** The optimum RPM and feed speeds are detailed in the diagrams attached to the tool tables.

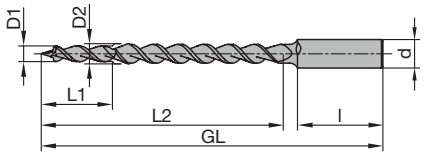

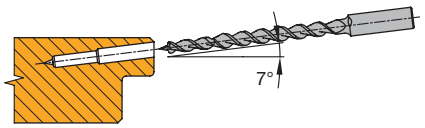

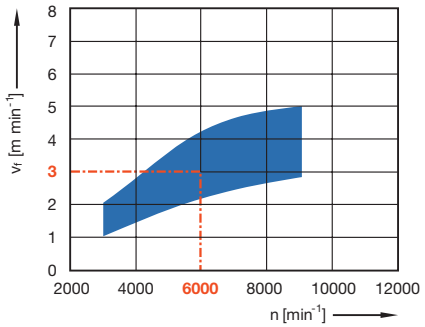

Drilling hole for screwed hinge at an inclined angle of 7° up to 9°

Feed speed v_f depending on the spindle RPM n

Workpiece material:
Chipboard plastic coated
Operation:
Step drilling
Correction factor for v_f:
MDF, solid wood = 0.7

HW solid, Z 2, Marathon

Application:
To produce stepped holes, particularly for screwed hinge holes for doors.

Machine:
Multi spindle units, CNC machining centres, portable drills.

Workpiece material:
Softwood and hardwood, chipboard and fibre materials (MDF, HDF etc.), uncoated, plastic coated, veneered etc., laminated veneer lumber (plywood, multiplex plywood etc.).

Technical information:
HW solid design, Z 2, two-steps. Extra-long centre point for perfect positioning of the boring bits even on inclined surfaces. Marathon coating for increased performance time.

HW solid, Z 2

Troubleshooting Chart

Problem	Possible cause	Action
Drill wears quickly	– Feed rate per rotation too low	Increase feed rate or reduce RPM (see charts on product pages)
High wear to spurs	– Tool remains stationary at the reversal point when drilling dowel holes	Reduce RPM or increase acceleration of the feed axis (when possible) Change program
	– Abrasive workpiece material	Select drills with more wear resistant cutting edge material (HW or DP)
Uneven edges (new drill)	– Feed rate per rotation too high as the bit enters or leaves the workpiece	Reduce feed rate or increase RPM (see charts on product pages)
	– Insufficient concentricity of drill	Check concentric clamping of bit and chuck Check spindle and chuck for deformation
	– Insufficient centering on return stroke of the drill	Check spindle and chuck for signs of wear Use drills with heel
Chips and workpiece become hot	– Tool too long at the reversal point when drilling dowel holes	Reduce RPM or increase acceleration of the feed axis (when possible) Change program
Burn marks at the bore wall (new drill)	– Insufficient chip flow	Clear gullet from time to time when drilling deep holes. Select drill type for high chip volumes (e.g. Levin type)
Bore too large	– Error in concentricity or the centre-point is not central	Check boring bit clamping for concentricity. Check boring bit chuck and motor spindle for deformation and wear Check the concentric running of the centre point
Unclean countersunk wood	– Chips jammed between flute and loose countersink	Use one-piece stepped boring bit when machining solid wood
Broken drill	– Wrong application parameters	Reduce feed rate, increase RPM (see charts on product pages)
	– Bore is full of chips	Clear gullet from time to time when boring deep holes. Select boring bit type for large chip quantities (e.g. Levin type).
	– Non-uniform workpiece material	Check workpiece for foreign objects Reduce feed rate
	– Premature loosening of workpiece clamping	Adjust program
	– Worn drilling spindle	Check spindle bearing, repair if necessary
Broken spurs	– High feed rate when drilling hard workpiece materials	Reduce feed rate
	– Workpiece material not suitable for machining with spurs	Grind off spur and chamfer cutting edge at change-over to the minor cutting edge

Worn spurs (abrasive wear)
The natural end of the performance time of a dowel or hinge boring bit is determined by worn spurs by abrasion. The cutting forces on the workpiece surface increase with increasing wear. The surface is subject to severe deformation before it is cut.

Consequently, the edge of the boring hole arches. Coated panel materials will show tear-outs and veneered surfaces crack at the edge of the boring hole. The boring bit must be replaced.

The performance time is set by the quality requirement of the holes. With visible holes such as holes for shelves, drill replacement should be carried out earlier than for holes for dowel joints.

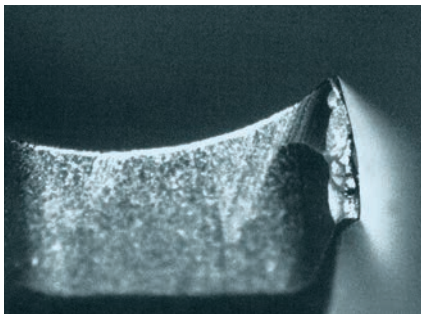

Worn spurs.

Broken spurs
The sharp and precise spurs of dowel and hinge boring bits are prone to mechanical overstress. They can break when used under unfavourable operating conditions.

This can be caused by worn spindles or chucks if the workpiece is not clamped firmly, or by hard foreign objects in the workpiece such as small stones or metal particles.

Broken spurs do not produce a clean cut since the break geometry is random. As a rule, this results in break-outs or tear-outs at the edge of the hole.

If the break geometry is favourable, the drilling quality does not deteriorate immediately. With continued use, these broken spurs are subject to fast abrasive wear. Performance times are considerably reduced. The wear can conceal the damaged spurs.

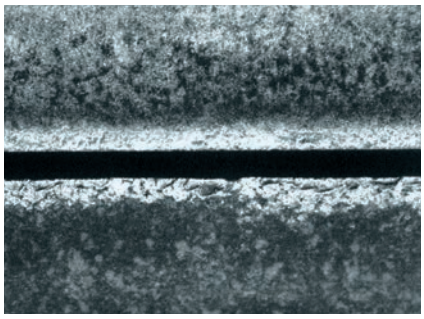

Broken spurs.

Thermal wear
Because of the permanent contact between the cutting edges and the workpiece material and the deep boring depth, operating conditions can occur which lead to heat stress.

Heat stress occurs when the heat developed by the friction at the main cutting edges cannot be dispersed by the chips. This can be caused by the wrong operating conditions such as high RPM at a low feed rate or when the boring bit remains stationary too long at the reversal point when boring dowel holes.

Insufficient chip removal at deep depths or resin build-up at the gullet can also lead to frictional heat.

The structure of the cutting material is destroyed thermally regardless of using HS, HW or DP. HS cutting materials overheat and lose hardness. The binding agent of sintered cutting materials such as HW or DP is attacked, grain breakage at the cutting edge can occur.

The cutting edges in the illustrations show the difference between abrasive wear (top) and wear caused by heat (bottom).

Clamping systems

Leitz Lexicon Edition 7 | Version 2 | 07/2025

Explanation of abbreviations

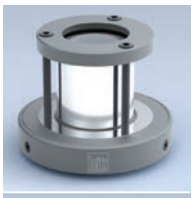

A	=	dimension A
a_e	=	cutting thickness (radial)
a_p	=	cutting depth (axial)
ABM	=	dimension
APL	=	panel raising length
APT	=	panel raising depth
AL	=	working length
AM	=	number of knives
AS	=	anti sound (low noise design)
b	=	overhang
B	=	width
BDD	=	thickness of shoulder
BEM	=	note
BEZ	=	description
BH	=	tipping height
BO	=	bore diameter
CNC	=	Computerized Numerical Control
d	=	diameter
D	=	cutting circle diameter
D0	=	zero diameter
DA	=	outside Diameter
DB	=	diameter of shoulder
DFC	=	Dust Flow Control (optimised chip clearance)
DGL	=	number of links
DIK	=	thickness
DKN	=	double keyway
DP	=	polycrystalline diamond
DRI	=	rotation
FAB	=	width of rebate
FAT	=	depth of rebate
FAW	=	bevel angle
FLD	=	flange diameter
f_z	=	tooth feed
$f_{z\ eff}$	=	effective tooth feed
GEW	=	thread
GL	=	total length
GS	=	Plunging edge
H	=	height
HC	=	tungsten carbide, coated
HD	=	wood thickness (thickness of workpiece)
HL	=	high-alloyed tool steel
HS	=	high-speed steel (HSS)
HW	=	tungsten carbide (TCT)
ID	=	ident number
IV	=	insulation glazing
KBZ	=	abbreviation
KLH	=	clamping height
KM	=	edge breaker
KN	=	single keyway
KNL	=	combination pinhole consists of 2/7/42 2/9/46,35 2/10/60
L	=	length
l	=	clamping length
LD	=	left hand twist
LEN	=	Leitz standard profiles
LH	=	left hand rotation
M	=	metric thread
MBM	=	minimum order quantity
MC	=	multi-purpose steel, coated
MD	=	thickness of knife
min^{-1}	=	revolutions per minute (RPM)
MK	=	morse taper
m min^{-1}	=	metres per minute
m s^{-1}	=	metres per second
n	=	RPM
$n_{max.}$	=	maximum permissible RPM
NAL	=	position of hub
ND	=	thickness of hub
NH	=	zero height
NL	=	cutting length
NLA	=	pinhole dimensions
NT	=	grooving depth
P	=	profile
POS	=	cutter position
PT	=	profile depth
PG	=	profile group
QAL	=	cutting material quality
R	=	radius
RD	=	right hand twist
RH	=	right hand rotation
RP	=	radius of cutter
S	=	shank dimension
SB	=	cutting width
SET	=	set
SLB	=	slotting width
SLL	=	slotting length
SLT	=	slotting depth
SP	=	tool steel
ST	=	Cobalt-basis cast alloys, e.g. Stellite™
STO	=	shank tolerance
SW	=	cutting angle
TD	=	diameter of tool body
TDI	=	thickness of tool
TG	=	pitch
TK	=	reference diameter
UT	=	cutting edges with irregular pitch
V	=	number of spurs
v_c	=	cutting speed
v_f	=	feed speed
VE	=	packing unit
VSB	=	adjustment range
WSS	=	workpiece material
Z	=	number of teeth
ZA	=	number of fingers
ZF	=	tooth shape (cutting edge shape)
ZL	=	finger length

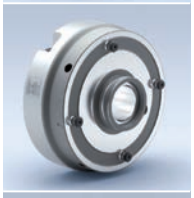

Notes to the Lexicon concerning the diagrams and tables

The statements made in the diagrams and tables relate to specific conditions and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

Hydro-Duo clamping element
PH 130 0 13 with end ring, clamping screws and safety device against twisting

For spindle without safety device against twisting

Application:
Clamping sleeve for centric, play-free clamping of tool sets, for window tools on stacked spindle machines.

Machine:
Machines with high precision spindles, e.g. moulders, double-end tenoners, edgebanding machines, window production machines etc.

Technical information:
Hydro-Duo closed hydro clamping system, activation of hydro clamping by internal clamping system without grease gun.
Total length of sleeves adjusted as required.

Hydro-Duo clamping element with axial piston clamping and fine adjustment
PH 130 0 11

Clamping collar without thread

Spindle without safety device against twisting - Hydro-Duo clamping sleeve with stepless fine adjustment of 2 part tool sets

Application:
Hydro-Duo clamping sleeve with fine thread and axial piston clamping for stepless adjustment of 2 part tool sets. Additional clamping collar with safety device against twisting.

Machine:
Machines with high precision spindles, e.g. moulders, double-end tenoners, edgebanding machines etc.

Technical information:
High precision fine thread adjustment with a 0.01 mm scale for fine adjustment of 2 part cuttersets with repeatability. Adjustment range 10 mm. Maintenance free hydro clamping mechanism.

With Hydro-Duo 2 chamber axial piston clamping and fine adjustment

Hydro Duo clamping element
PH 130 0 04

Spindle with safety device against twisting - hexagon HF spindle 40 Hydro-Duo clamping sleeve

Application:
Hydro-Duo clamping element for play-free clamping of cutting tools on high precision spindle with hexagon safety device against twisting (HF spindle) for high concentricity.

Machine:
Machines with high precision spindles, e.g. moulders, double-end tenoners, edgebanding machines etc.

Technical information:
Closed hydro clamping system with maintenance free pressure piston mechanism.
RPM n_{max} 12000 min^{-1}.
Attention: Comply with maximum admissible speed for the mounted tools!

With end ring and clamping screws, for tool sets with bore 60 mm

Spindle with safety device against twisting - hexagon HF spindle 30 Hydro clamping sleeve

Application:
Hydro clamping sleeve for play-free clamping of cutting tools on high precision spindle with hexagon safety device against twisting (HF spindle 30) for high concentricity.

Machine:
Machines with high precision spindles diameter 30 mm, e.g. edgebanding machines, double-end tenoners, moulders etc.

Technical information:
Closed hydro clamping system with maintenance free pressure piston mechanism. User friendly axial handling of the hydro clamping screw from top. Safety against twisting on the spindle through an appropriate hexagon in the spindle fixture.
RPM n_{max} 12000 min^{-1}.
Attention: Comply with maximum admissible speed for the mounted tools!

Hydro quick clamping sleeve
type 160 HF

Spindle with safety device against twisting - hexagon HF spindle 40 Quick clamping sleeve type 160 Hydro

Application:
Quick clamping sleeve for tools and hoggers on high precision spindle D = 40 mm with hexagon safety device against twisting.

Machine:
Double-end tenoners, edgebanding machines etc.

Technical information:
Hardened steel tool body, with mechanical quick clamping mechanism without compressed air. Tool is mounted directly on the quick clamping system without intermediate flange, closed hydro clamping system with maintenance free pressure piston mechanism, suitable for right hand and left hand rotation.
RPM n_{max} = 9000 min^{-1}. Tools must have four bayonet holes on 130 mm pitch.
Attention: Comply with maximum admissible speed for the mounted tools!

Quick clamping sleeve type 110

Application:
For quick clamping of scoring sawblades, grooving sawblades and tools.

Machine:
Double-end tenoners, finger joint machines, edgebanding machines etc.

Technical information:
For standard spindle (DKN), hardened steel tool body with mechanical operation of the quick clamping mechanism without compressed air. Tool is mounted directly or by using a flange, suitable for right hand rotation and left hand rotation.

For scoring sawblades and tools

7.3 Clamping chucks
7.3.1 Shrink-fit chucks

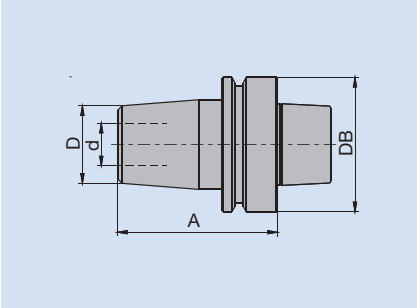

Application

Clamping of shank tools with high precision and stability.

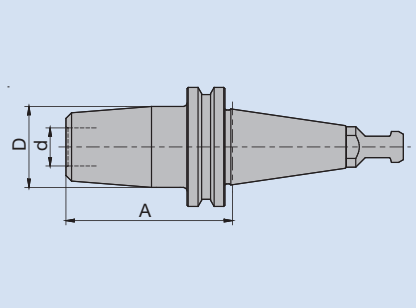

Machine

Stationary routers with/without CNC control and cutter spindles for automatic tool change.
Milling machines with cutter spindles for automatic tool change.

Technical features

Shrink-fit chuck with hollow taper shank.

Shrink-fit chuck with steep taper.

D	Largest diameter of the chuck in the clamping area
d	Clamping or bore diameter
DB	Outer diameter of groove
A	Length from reference point on steep taper or HSK reference surface

Permissible shank tolerances

Tools clamped in shrink-fit chucks must have at least the following tool shank tolerances:

	Diameter of shank	
Tools mounted in	< 12 mm	≥ 12 mm
Shrink-fit chucks	ISO h6	ISO g6

Application data

Maximum RPM
The maximum RPM for shrink-fit chucks: n_{max} = 36000 min^{-1}.

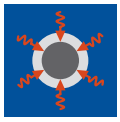

Operation

Shrink-fit chucks have a bore smaller than the diameter of the shank to be clamped. The chuck is opened by heating the chuck in the clamping area. The HF generator, enables quick and secure expansion of the shrink-fit chucks by induction heating allowing.
The tool can be fitted / replaced. After the chuck has cooled down the tool is ready for use.
After short, quick heating the tool can be removed or fitted. After the chuck has cooled down the tool can be used.

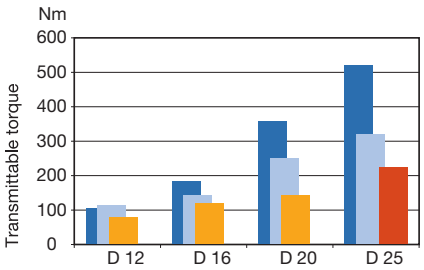

Leitz High Frequency Generator ISG3400.

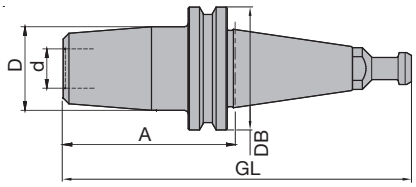

Comparison of transferable torque of traditional clamping chucks

- ThermoGrip® shrink-fit chuck
- Collet DIN ISO 10897-B25, 75 Nm Tightening torque
- Collet DIN ISO 15488-B32 (ER32), 75 Nm Tightening torque
- Hydro clamping chuck

The clamping range of collet chucks and hydro clamping chucks includes shank tolerances g7 and h6. Leitz ThermoGrip® chucks are designed for a shank tolerance h6 for clamping diameters d < 12 mm and a shank tolerance g6 for clamping diameters d ≥ 12 mm.

Shrink-fit chuck ThermoGrip® Tapered

Application:
High precision tool chuck for clamping shank tools by thermal shrinking. Has the highest stability and rigidity of all known shank tools clamping systems, suitable for HSC and HPC machining.

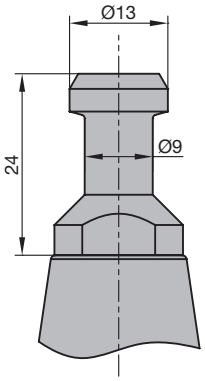

Technical information:
Tool chuck for high performance. Precision-balanced for speeds up to 36000 min^{-1}. Short, slim design for improved chip flow extraction. For clamping tungsten carbide and steel shanks. Clamping eccentricity e ≤ 0.01 mm. Integrated length adjustment to adopt the clamping depth of the tool.

See: Brochure ThermoGrip® shrink-fit generator.

Shrink collet ThermoGrip®, Type TER, DIN ISO 15488

Application:
High precision tool chuck for clamping shank tools by thermal shrinking. Has the highest stability and rigidity of all known shank tools clamping systems, suitable for HSC and HPC machining.

Technical information:
Replacement for conventional spring collets to increase concentricity, rigidity and speed strength. Universal design for the adaptation of shank tools in machining aggregates as well as direct clamping in spindles with integrated collet adaptor.
For clamping of carbide and steel shanks. Clamping eccentricity e ≤ 0.01 mm.
Attention: In order to mount the collet nut in the shrinked tool, the tool diameter is not allowed to be larger than the collar diameter (DB) stated in the table. In individual cases the existing clamping nut must be exchanged with the version stated in the table.

Application

High precision clamping of shank tools.

Machine

Stationary routers with CNC control and spindles for automatic tool change.
Milling machines with spindles for automatic tool change.

Technical features

Hydro chucks are used to clamp shank tools in spindles with high precision.
Hydro chucks have the same concentric run out tolerance as shrink-fit chucks, but shrink-fit chucks have considerably higher stability.
Shrink-fit chucks are recommended for high cutting forces machining operations.

Permissible shank tolerances

Tools clamped in hydro chucks must have the following tool shank tolerances:

	Diameter of shank	
Tools mounted in	< 12 mm	≥ 12 mm
Hydro chucks	ISO h6	ISO g6

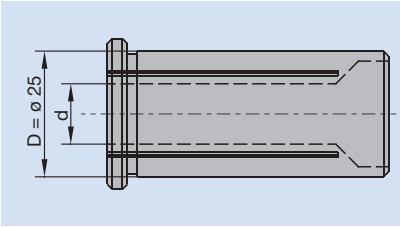

Application data

Maximum RPM
Maximum RPM for hydro chucks: n_{max} = 25000 min^{-1}.

Reducing the clamping diameter

The standard clamping diameter for Leitz hydro chucks is 25 mm. Other shank diameters are clamped using reducing sleeves. The use of reducing sleeves significantly decreases the clamping force and the concentric run out tolerance. It is recommended not to reduce the shank diameter except when absolutely necessary.

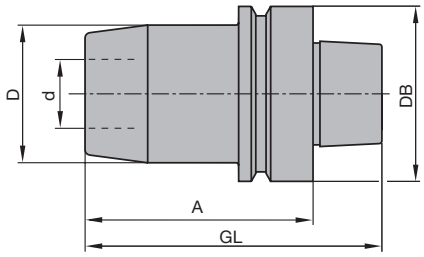

The following shank diameters can be clamped with reducing sleeves:

D	25 mm
d	12 mm 14 mm 16 mm 20 mm

Hydro chuck HSK-F 63

Hydro chucks for shank tools with hollow shank taper HSK-F 63

Application:
High precision tool chuck for hydro clamping shank tools with cylindrical shank and shank diameters up to d_{max} = 25 mm.

Technical information:
Reduction of clamping diameter by special reduction inserts. Independent of direction of rotation, suitable for right hand and left hand rotation tool. Easy handling clamping system. Tool adaptor finely balanced. Maximum admissible speed n_{max} = 25000 min^{-1}.

Clamping diameter 25 mm
PH 350 0

Application

Clamping system for shank tools.

Machine

Stationary routers with/without CNC control, CNC machining centres
Milling machines with spindles to mount shank tools,
Router machines without automatic tool change,
Portable routers.

Technical features

Collet chuck HSK-F 63.

D	Largest diameter of the chuck in the clamping area
d	Tool shank clamping diameter
DB	Diameter of chuck face
A	Length to reference point (SK) or to reference surface (HSK)

Permissible shank tolerances

Tools clamped in collet chucks must have at least the following tool shank tolerances:

	Diameter of shank	
Tools mounted in	< 12 mm	≥ 12 mm
Collet chuck	ISO g7	ISO g7

Collet nut clamping torque

The following torques are required for safe clamping of the tool in the collet chuck:

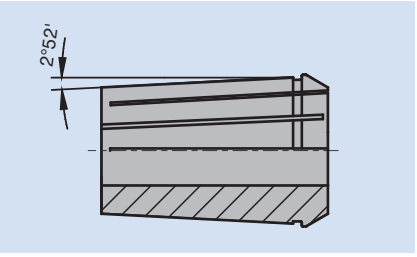

Collet nut thread	Spanner type	Clamping torque
M 30 x 1,5	SW 40/42	60 Nm
M 33 x 1,5	SW 40/42	60 Nm
M 40 x 1,5	SW 45/50	80 Nm
M 48 x 2	SW 58/62	100 Nm
M 50 x 1,5	SW 58/62	100 Nm

Application data

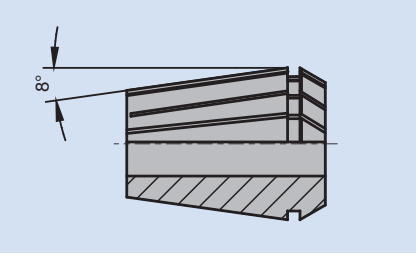

Maximum RPM
The maximum RPM for collet chucks:
n_{max} = 24000 min^{-1} (shank diameters up to 25 mm).
HSC Collet chucks (High Speed Cutting) have a maximum RPM: n_{max} = 30000 min^{-1}.

Collet chuck design

Leitz collet chucks are available for the two designs of collet below.

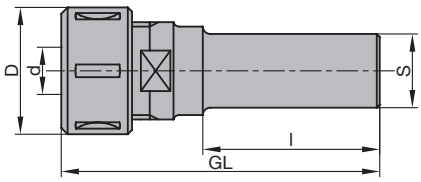

Collet taper angle 2°52': DIN ISO 10897.

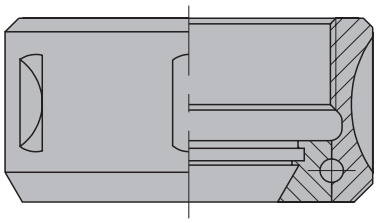

Collet taper angle 8°: DIN ISO 15488.

Collets with a taper angle of 2°52', taper tolerance 1:10, DIN ISO 10897 are recommended.

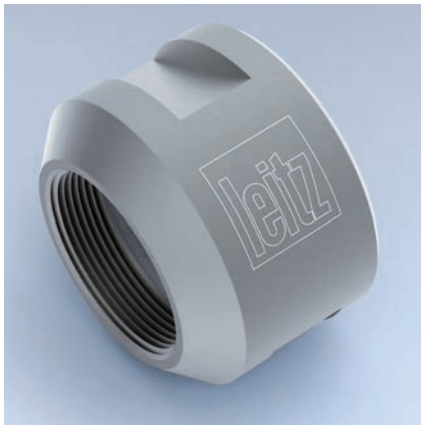

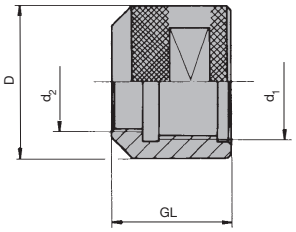

Collet chuck with cylindrical shank

Ball bearing collet nut

Fixing nut TK 510 0
d_1 = machine related
d_2 = tool related

Precision collet chuck, cylindrical shank

Application:
Precision tool chuck with collet for clamping shank tools with cylindrical shank and shank diameters up to d_{max} = 16 mm.

Technical information:
Exact concentricity through hardened, ground and double slotted collets. Easy handling as loosening the ball bearing collet nut automatically opens the collet. Suitable for right and left hand rotation because of ball bearing collet nut. Ball bearing collet nut for increased clamping forces and improved concentricity compared to monobloc design.

Clamping nut for morse taper II shanks

Application:
For clamping tools or tool chucks with morse taper II shanks (MK II).

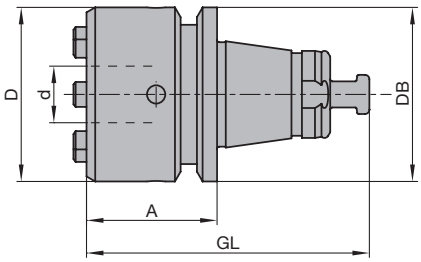

Technical information:
d_1 = W 1 1/8" suitable for Perske and Maka motor spindles.
d_1 = M 33 X 3 suitable for Italian routers.

With differential thread

Collet chuck

Collet chuck with steep taper for CNC aggregates

Application:
Precision tool chuck with collet for clamping shank tools with cylindrical shank and shank diameters up to d_{max} = 16 mm (5/8“).

Technical information:
Steep taper design for Flex 5+ aggregates (Homag Group) and 5-motion-Plus aggregate (Felder Format-4). Exact concentric running through hardened, ground and double slotted collets. Easy handling through automatic opening of the collet when opening the collet nut. Tool adaptor and collet nut fine balanced. Maximum tool protrusion of the chuck = 50 mm. A collet with clamping diameter 10 mm is included.

A = 30 mm, diameter range 3-16 mm

Collet chuck with steep taper

Collet angle 8°: DIN ISO 15488

Ball bearing collet nut

Type: B
SK 30/ISO 30 pull stud for HSD spindles from construction year 9/92 on

Collet chuck with steep taper SK 30

Application:
Precision tool chuck with collet for clamping shank tools with cylindrical shank and shank diameters up to d_{max} = 20 mm.

Technical information:
Steep taper design as per DIN ISO 7388, without grooves and notches. Exact concentric running through hardened, ground and double slotted collets. Vibration free cutting by short design. Easy handling through automatic opening of the collet when loosening the collet nut. Suitable for right hand and left hand rotation due to ball bearing collet nut. Ball bearing collet nut for increased clamping forces and improved concentricity compared to monobloc design. Tool chuck and collet nut fine balanced. Suitable mounting device VN 799 0 see section Knives and Spare Parts.

NiRo collet chuck Premium HSK-F 63

Collet angle 2°52‘: ISO 10897, Form B

Special key especially for NiRo collet chuck Premium

Torque wrench with insert for precise clamping

NiRo Collet chuck *Premium* with hollow taper shank HSK-F 63

Application:
Precision tool chuck especially for use in difficult climatic conditions with collet for clamping shank tools with cylindrical shank and shank diameters up to d_{max} = 25.4 mm (1“).

Technical information:
Long tool life due to the use of corrosion-resistant steel. Hollow taper shank as per DIN 69893. Exact concentric running through hardened, ground and double slotted collets. Easy handling as loosening the ball bearing collet nut automatically opens the collet. Suitable for right hand and left hand rotation because of ball bearing collet nut. Ball bearing collet nut for increased clamping forces and improved concentricity compared to monobloc design. Tool chuck and collet nut fine balanced. Suitable mounting device VN 799 0 see section Knives and Spare Parts. Easy and safe clamping and releasing by clamping key with optimised spanner flats.

HSK-F 63, DIN 69893, A = 78, diameter range 6-25.4 mm

Ball bearing collet nut

Collet chuck with hollow taper shank HSK-F 63

Application:
Precision tool chuck with collet for clamping shank tools with cylindrical shank and shank diameters up to d_{max} = 30 mm.

Technical information:
Hollow taper shank as per DIN 69893. Exact concentric running through hardened, ground and double slotted collets. Easy handling as loosening the ball bearing collet nut automatically opens the collet. Suitable for right hand and left hand rotation because of ball bearing collet nut. Ball bearing collet nut for increased clamping forces and improved concentricity compared to monobloc design. Tool chuck and collet nut fine balanced. Suitable mounting device VN 799 0 see section Knives and Spare Parts.

Application

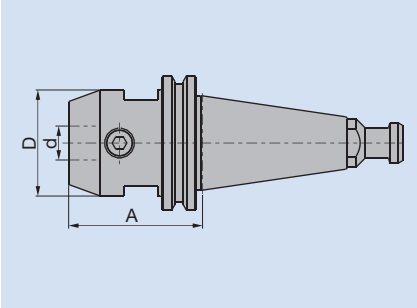

High-stability shank tool clamping.

Machine

Stationary routers with CNC control and spindles for automatic tool change.
Milling machines with spindles for automatic tool change.

Technical features

Weldon chucks are used to clamp shank tools rigidly.
Weldon chucks have a similar rigidity to shrink-fit chucks, but the run out tolerance of shrink-fit chucks is significantly higher.
Shrink-fit chucks are recommend for machining operations demanding high quality.

D	Largest diameter of the chuck in the clamping area
d	Clamping or bore diameter
A	Length from the reference point on the steep taper or the HSK reference surface

Permissible shank tolerances

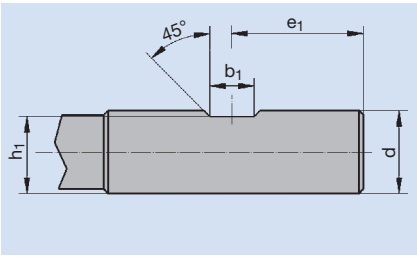

Tools clamped in weldon chucks must have at least the following tool shank tolerances:

	Diameter of shank	
Tools mounted in Weldon chucks	16 mm	20 mm
	ISO g7	ISO g7

Clamping flat

The shanks of tools clamped in Weldon chucks must have a driving flat to DIN 1835.

The following drawing details the dimensions of the clamping flat:

d	e_1	b_1	h_1
16	24	10	14.2
20	25	11	18.2

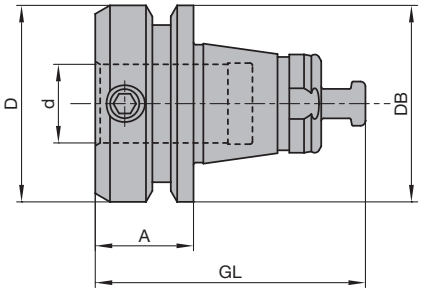

Application data

Maximum RPM
Maximum RPM for Weldon chucks: n_{max} = 24000 min^{-1}.

Order information

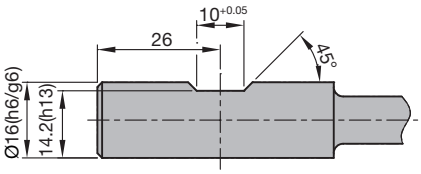

Weldon chucks with adaptors SK 30 / SK 40 as well as HSK-E / HSK-F supplied on request.

Weldon clamping chuck

Required shank design:

Clamping chuck with steep taper for CNC aggregates

Application:
Precision tool chuck for clamping shank tools with cylindrical shank and shank diameters up to d_{max} = 16 mm.

Technical information:
Steep taper design for Flex 5+ aggregates (Homag Group) and 5-motion-Plus aggregate (Felder Format-4). High stability for medium difficult cutting operations. Easy tool change through opening of the radial clamping screw. Tool adaptor fine balanced. Maximum tool protrusion (length projecting of the chuck) 60 mm.

A = 20 mm, clamping diameter 16 mm

Application

Clamping drills.

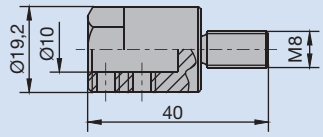

Machine

Stationary routers with CNC control and spindles for automatic tool change.
Milling machines with spindles for automatic tool change.
Routers without automatic tool change.
Drilling machines.

Technical features

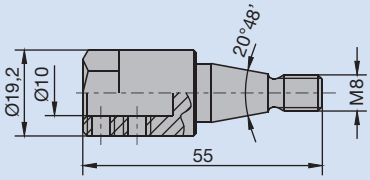

1. Conventional drill adaptors
Drill adaptors are used to mount dowel drills, through hole drills or hinge boring bits in drilling machines.
Below an overview of the available adaptors:

A

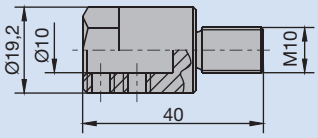

Nottmeyer
(old machine design)

E

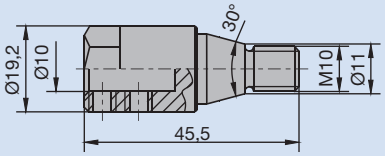

Bilek Type K and N
Knoevenagel

B

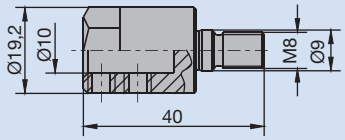

Ayen, Brandt
Knoevenagel
Mayer
Reichenbacher
Torwegge
Zubiola

F

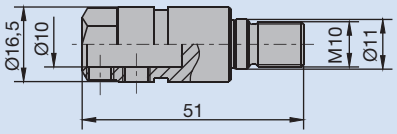

Alberti, Balestrini, Bilek
Busellato, Dubus, Goma
Grotefeld, Ompec, Reimall
SCM, Schleicher, Tanzani
Viciani, Vitap (before year 4/91)
Weingärtner

C

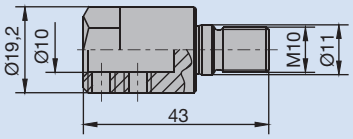

Lehbrink
Nottmeyer
(new machine design)

G

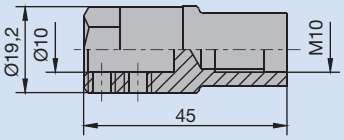

Morbidelli

D

Alberti, Balestrini, Biesse
Böttcher & Gessner
Busellato, Goma, Grotefeld
Hüllhorst, Holz-Her, Koch
Morbidelli, Reimall, Torwegge
Vitap (after year 4/91)
Weeke

H

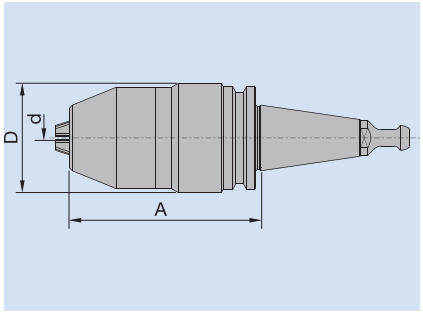

Scheer

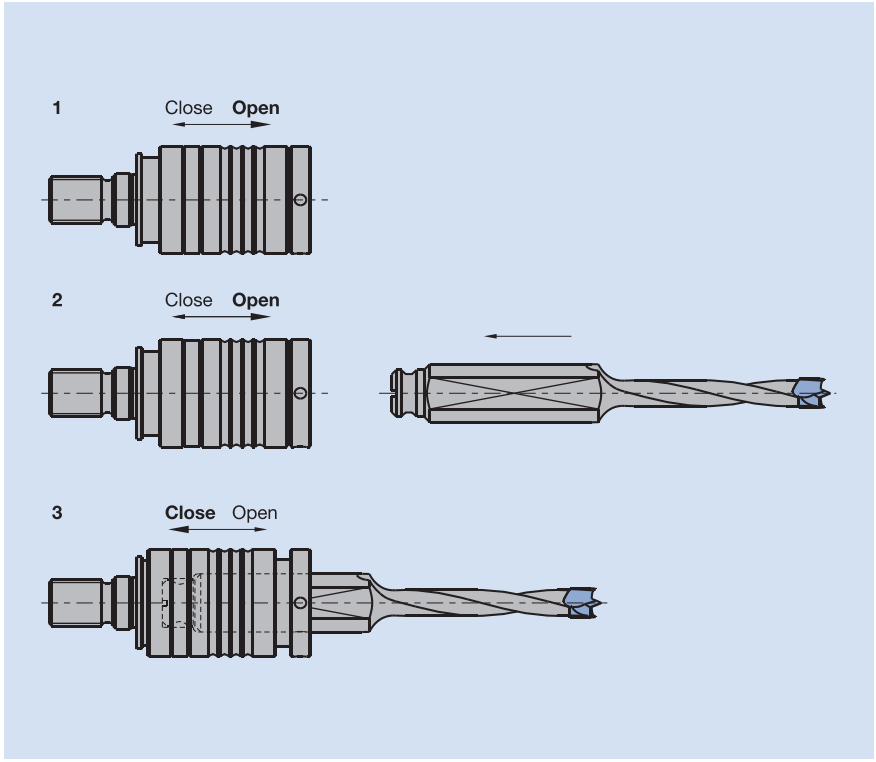

The drill is clamped in the adaptor by a screw. The shank has to have a driving flat.

2. Drill chuck for CNC machining centres
Drill chucks are an easy way to carry drills in machines with magazines. The drill chuck is a 3 wedge chuck with an interface to suit the tool spindle.

D	Largest external diameter of the chuck
d	Clamping diameter
A	Length from the reference point (steep taper) or reference surface (HSK)

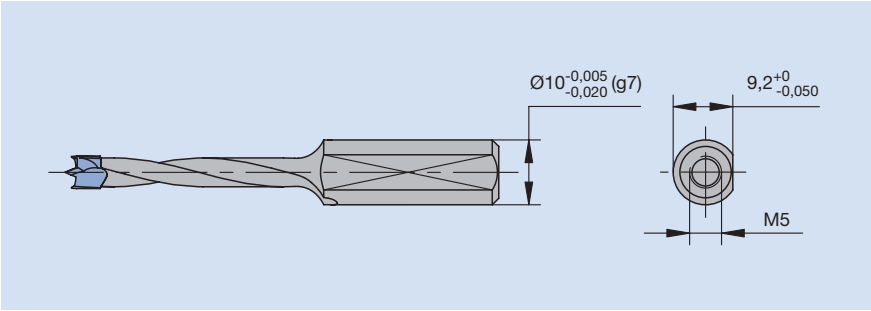

3. Quick change adaptor
Adaptor system for dowel drills, through hole drills and hinge boring bits for different drilling machines. The quick change adaptor is a quick and easy way to change drills in the machine without using tools.

Changing a drill.
For a perfect fit of the shank a special length adjustment screw (ID **009157**) is required. This screw allows exact length adjustment of the mounted drills.

Required shank tolerance

Clamping drills safely requires the following shank and driving flat tolerance:

Application Data

Maximum allowable RPM
Maximum allowable RPM for drill adaptors (adaptor in spindle):
n_{max} = 9000 min^{-1}.

Conventional drill adaptors and quick change adaptors can be used up to
n_{max} = 12000 min^{-1}.

Drill adaptor, conventional clamping

Application:
Clamping chuck for drill bits with 10 mm shank diameter and driving flat for drilling spindles with threaded adaptor.

Technical information:
Stable and secure clamping of drills by 2 clamping screws. Smallest spindle pitch in the drilling unit: 21 mm. For narrower pitches, 8 mm shank chucks and drills must be used.

Drill adaptor, quick clamping design

Application:
Quick clamping chuck for drills with 10 mm shank and driving flat for drilling spindles with threaded adaptor.

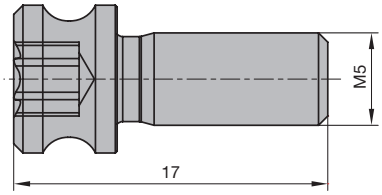

Technical information:
The drill is held in the chuck by the length adjusting screw (ID **009157**). Ideal if the hole diameter must be changed quickly. Quick clamping chucks not in use should be covered using the optional dust cover.
Note: The drill shanks require an appropriate shank and driving flat dimensional tolerance to ensure trouble free operation. Drills from the Leitz range guarantees functional reliability. Speed up to 12000 min^{-1} (quick change drill adaptor without drill must be covered with the dust cover ID **115521** for speeds exceeding 9000 min^{-1} to prevent unbalance).

Mounting device ID **115522**

7.4 Clamping arbors
7.4.1 Hydro clamping arbors

Application

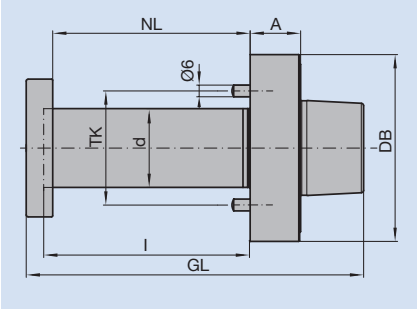

Play-free mounting of single cutters or cuttersets with bore.

Machine

Stationary routers with CNC control and spindles for automatic tool change.
Milling machines with spindles for automatic tool change.

Technical features

Hydro clamping arbors are used to mount tools, cutterheads, cutters and sawblades on CNC machining centres or continuous machines with spindles for automatic tool change. Hydro clamping enables play-free clamping of respective tools.

d	Diameter of the arbor
NL	Clamping length
DB	Outer diameter groove
A	Length from reference point (steep taper) or reference surface (HSK)
DTK	Pitch diameter, screw or pin bore

Permissible bore tolerances

Tools mounted on arbors must have at least the following bore tolerance:

	Bore tolerance
Tools mounted on hydro clamping chucks	ISO H7

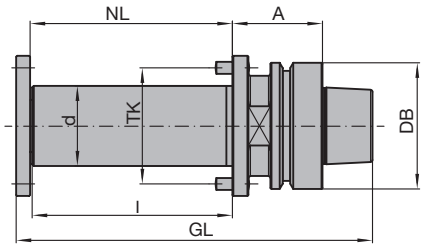

Information

Please observe the data of the machine producer for the allowed maximal weight and diameter as well as the maximal tool RPM!

Hydro clamping arbor HSK-F 63

Hydro clamping arbor HSK-F 63 / HSK-E 63

Application:
For precise and play-free mounting of tools with bore, such as sawblades, tools, toolsets and cutterheads.

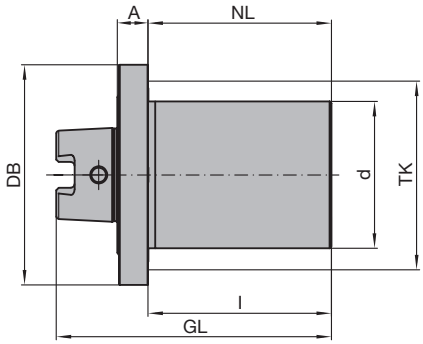

Machine:
Machines with HSK-F 63 or HSK-E 63 adaptor, e.g. moulders, window producing machines, CNC-machining centres etc.

Technical information:
Hollow taper shank design as per DIN 69863. Play-free and precise adaption of bore tools through hydro clamping arbors. Axial clamping actuation of the closed hydro system. Safety against twisting of the tools through pins and screws.
Note: Please observe the admitted maximum weight and diameters as well as the maximum tool RPM of the machine producer!

HSK-F / E 63, A = 45 / 90 mm

Hydro clamping arbor HSK-F 63 mod.
PH 160 0 02

Hydro clamping arbor HSK-F 63 mod.

Application:
Hydro clamping arbor for precise and play-free mounting of tools with bore such as circular sawblades, tools, toolsets and cutterheads for high concentricity.

Machine:
Machines with HSK-F 63 interface, e.g. laminate and parquet flooring lines, edgebanding machines, double-end tenoners, profile cutting machines etc.

Technical information:
Closed hydro clamping system with maintenance free pressurising piston mechanism. User friendly axial positioned hydro clamping screw. Play-free and precise mounting of tools with bores on hydro clamping arbors. Suitable for RH and LH. RPM n_{max} 12000^{-1}.
Note: Check the allowed maximum RPM of the tool mounted on the arbor!

Application

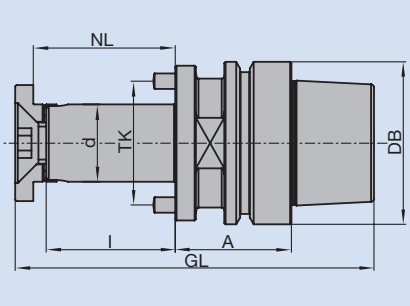

For mounting single cutters or cuttersets with bore.

Machine

Stationary routers with CNC control and spindles for automatic tool change, Through-feed machines and milling machines with spindles for automatic tool change.

Technical features

Cutter arbors are used to mount tools, cutterheads, cutters and sawblades on CNC machining centres or trough-feed machines with spindles for automatic tool change. The arbor clamping length can be altered to suit the application and tool.

d	Diameter of the arbor
l	Clamping length
DB	Outer diameter groove
A	Length from reference point (steep taper) or reference surface (HSK)
DTK	Pitch diameter, screw or pin bore

Permissible bore tolerances

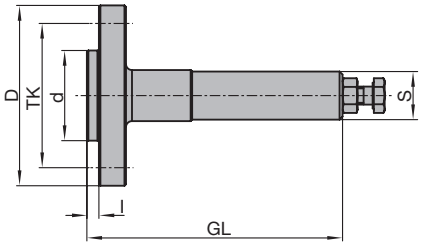

Tools mounted on arbors must have at least the following bore tolerance:

	Bore tolerance
Tools mounted on arbors	ISO H7

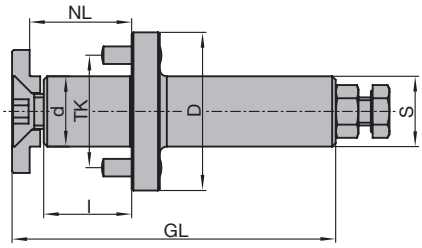

Information

Please observe the data of the machine producer for the allowed maximal weight and diameter as well as the maximal tool RPM!

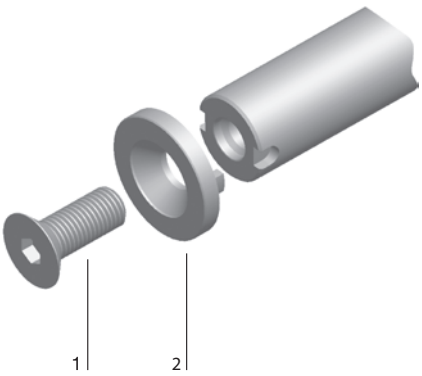

Arbor, short design

Arbor, long design

1 Clamping screw
2 Conical spring washer for safety against twisting

Cutter arbor with cylindrical shank

Application:
Arbor for single tools with bore or tool sets with bore.

Technical information:
Cylindrical shank design. Short design for grooving cutter and sawblades up to widths NB = 10 mm. Long design for one part or multi part tools/tool sets. Safety device against tool twisting by screw or pin. Cutter arbors are fine balanced.
If conical spring washers with safety device against twisting are used, slots are required in the cutter arbor.
Note: Maximum admissible speed n_{max} depends on the mounted tools. Please comply with the specifications regarding the maximum admissible weight and diameters detailed by the machine manufacturer.

Arbor SK 30/SK 40

1 Clamping screw
2 Conical spring washer for safety against twisting

Cutter arbor with steep taper SK 30 / SK 40

Application:
Arbor for single tools with bore or tool sets with bore.

Technical information:
Steep taper design as per DIN ISO 7388, without grooves and notches. Short design, suitable for low vibration cutting. Safety device against tool twisting by screw or pin. Arbors are fine balanced. If conical spring washers with safety device against twisting are used, slots are required in the arbor. For suitable mounting device VN 799 0, see section Knives and Spare Parts.
Note: Please comply with the specifications regarding the maximum admissible weight and diameters detailed by the machine manufacturer!

Arbors HSK-F 63 mod. (ID **663052**) with flange

Arbor HSK-F 63 mod. (ID **663053**) with end ring and clamping screws

Cutting arbor with hollow taper shank HSK-F 63 mod.

Application:
Arbors for single tools with bore or tool sets with bore. For precise clamping in the machine spindle and quick tool change, mainly on Homag through feed machines with HSK-F 63 mod. motor spindle.

Machine:
Double-end tenoner, flooring machines, edgebanding machines etc.

Technical information:
Fine balanced arbors with hollow shank taper modified design as per DIN 69893 HSK-F 63. Precise tool clamping for high concentricity. Clamping screws and end ring are part of the arbor.

Application

Clamping and mounting of circular sawblades.

Machines

Stationary routers with CNC control and spindles for automatic tool change.
Milling machines with cutting spindles for automatic tool change.

Technical features

Circular sawblade adaptors are used to mount sawblades on CNC machining centres or through feed machines with automatic tool change tool spindles.
- Design without flange suitable for deep mitre cuts on 5-axis CNC machining centres.
- Design with clamping flange for precise cuts and multi purpose applications.
- Multi-purpose design for variable applications on all arbors with diameter d = 30 mm.

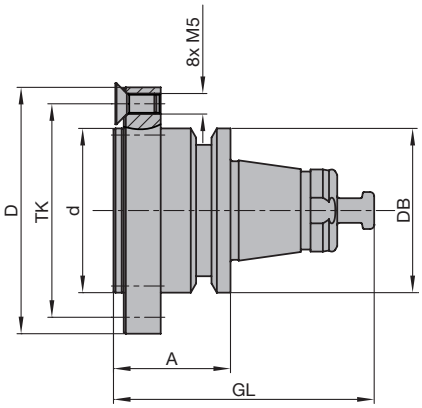

Sawblade mounting flange with HSK-F 63 adaptor.

Allowed bore tolerances

Circular sawblades mounted on sawblade flanges have to have the following bore tolerances:

	Bore tolerance
Circular sawblade for sawblade flange	ISO H7

Saw blade adaptor

Tool adaptor for circular sawblades for CNC aggregates

Application:
Tool adaptor with flange for the adaption of circular sawblades.

Technical information:
Steep taper design for Flex 5+ aggregate (Homag Group) and 5-motion-Plus aggregate (Felder Format-4). The circular sawblade is fixed through 8 countersink screws M5 on the flange. Maximum sawblade diameter 220 mm (limitation through the aggregate). The maximum cutting width of sawblade is limited to 6 mm. Tool adaptor is fine balanced.

Clamping variant with counter flange

Clamping variant with concentrically mounted sawblade

Tool adaptor for circular sawblades

Application:
Tool adaptor with flange for the adaption of circular sawblades.

Technical information:
Optionally mounting the sawblade by means of counterscrews or with the enclosed counterflange. Mounting with counterflange is preferred for increased stability and concentricity in case of precision cuts. Application without counterflange is preferred for producing mitre and rafter cuts. Maximum diameter of sawblade 350 mm (450 mm with counter flange).

Flange TR 810 0

Note:
Variable clamping length through the combination of spacers without pins and spacers with pins for the safety device against twisting ID **028674**. Maximal thickness of the spacers without safety device against twisting = 10 mm.

Flange for circular sawblades

Application:
To mount circular sawblades on arbors.

Technical information:
Sawblade flange is mounted on arbor with diameter d = 30 mm by clamping screws and pins. The length and the dimension A are flexible and defined by spacers. Maximum sawblade diameter 350 mm.

NAL	=	position of hub
ND	=	thickness of hub
NH	=	zero height
NL	=	cutting length
NLA	=	pinhole dimensions
NT	=	grooving depth
P	=	profile
POS	=	cutter position
PT	=	profile depth
PG	=	profile group
QAL	=	cutting material quality
R	=	radius
RD	=	right hand twist
RH	=	right hand rotation
RP	=	radius of cutter
S	=	shank dimension
SB	=	cutting width
SET	=	set
SLB	=	slotting width
SLL	=	slotting length
SLT	=	slotting depth
SP	=	tool steel
ST	=	Cobalt-basis cast alloys, e.g. Stellite™
STO	=	shank tolerance
SW	=	cutting angle
TD	=	diameter of tool body
TDI	=	thickness of tool
TG	=	pitch
TK	=	reference diameter
UT	=	cutting edges with irregular pitch
V	=	number of spurs
v_c	=	cutting speed
v_f	=	feed speed
VE	=	packing unit
VSB	=	adjustment range
WSS	=	workpiece material
Z	=	number of teeth
ZA	=	number of fingers
ZF	=	tooth shape (cutting edge shape)
ZL	=	finger length

Notes to the Lexicon concerning the diagrams and tables

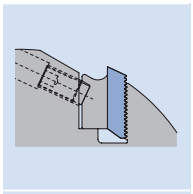

The statements made in the diagrams and tables relate to specific conditions and represent parameters from tests subjected to defined conditions. Variations when using tools in individual case due to special application conditions may be possible. Our support team will provide you with detailed information.

- Blank knives with polished cutting face for high cutting edge quality.
- Solid tungsten carbide - profile knives, adjustable (1.80 mm steps).
- Knives supported by profiled backing plates.
- Resharpening area 10.8 mm at maximum profile depth.

Set of the same weight.

Cutting material:
HW-30F / HW-10F

Attention:
Maximum knife protrusion above the backing plate 4.5 mm. For safety reasons, only mount knives and backing plates of same weight in opposite seatings.

Table to determine maximum profile depth.
The profile depth figures are to be regarded as standard values. The maximum profile depth depends on the tool diameter and cutting angle.

Attention:
For safety reasons, always mount knives of the same weight in opposite seatings

The indicated profile depth values should be regarded as standard values for information. The maximum profile depth depends on the tool diameter and cutting angle.

Set of the same weight.
- Blank knives with polished cutting face for high cutting edge quality.
- Solid tungsten carbide - profile knives, adjustable (1.80 mm steps).
- Knives supported by profiled backing plates.
- Resharpening area 10.8 mm at maximum profile depth.

Cutting material:
HW-30F / HW-10F

Attention:
Maximum knife protrusion above the backing plate 4.5 mm. For safety reasons, only mount knives and backing plates of same weight in opposite seatings.

For profile and hydro profile cutterheads, PT 20 mm
AT 103 0 26, AT 107 0 26

Service in maximum precision

Tools as new – this is based on the philosophy of maximum performance and near perfect processing quality during the total life cycle of our products. Thereby, our tool service plays a decisive role. In compliance with the optimum quality standards, we have brought Leitz Service to achieve absolute precision.

Professional maintenance

Used tooling quite often means uneven wear. This sometimes causes damaged or even knife breakage. In this case we repair your tooling exclusively with the original spare parts and original production techniques – result being for tools as good as on the very first day!

Uniform quality standards

No matter where in the world you make use of our service, you can rely on our total quality standards. We develop these standards on the basis of intensive research and development in our company headquarters. Therefore we can ensure that all Leitz sites worldwide provide optimal service quality at all times.

Tools as new

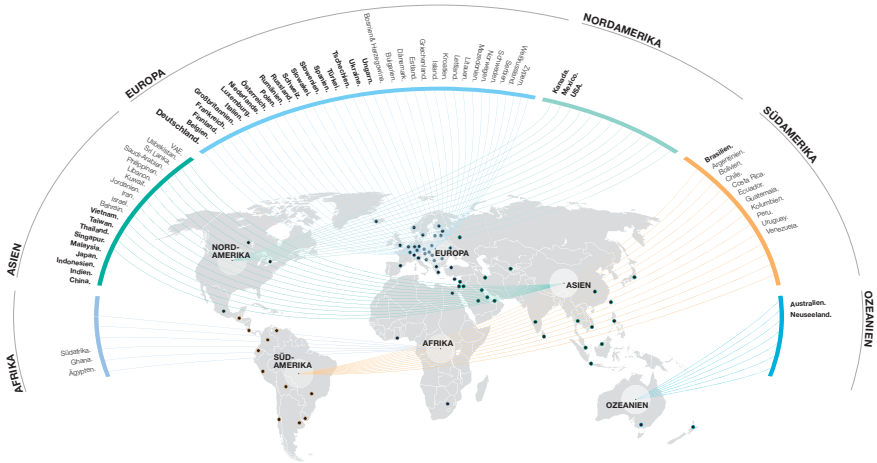

In our service stations we use the same machinery and programs as in our tool production. Therefore our tools provide consistent top quality and efficiency – whether they are brand new directly from our production plant or resharpened from the service station.

Service for all types of tools

Stacking all of the circular saws which we sharpen every year, we would have a tower nearly ten kilometres high. Our service stations not only accept circular saw blades, collectively more than tens of millions of further tools are serviced per year. With that, globally, we are by far the biggest service provider for tools in the wood and plastic processing sectors.

Extensive network

Globally we are represented in 36 countries with our own company sites. There are hardly any areas on the planet where we are not close to our customers. In all these countries, we have our own service stations also. Today, more than 100.000 customers trust in Leitz Service – become one of them.

Chip coding

A microchip in the tool or clamping interface is coded with all the relevant tool geometry and safety data. The microchip is identified and read by the machine without contact. Besides reducing set-up time, this technology also improves operating safety.

Chip-coding-hardware

Chip-coding-software and a PC work station are necessary for operation.

The right tool, the right quantity, the correct quality on time and on site – tasks to be monitored to keep your production running. These non-value-adding activities absorb time and resources, both would be better used on other activities.

When it comes to supplying tools, Leitz has international experience and can give you a customised tool management system. Demand for tools and the money spend on tools are reduced as the tools are easy to locate and replacement tools ordered on time through the automated systems. Controlling the tool life and run time aids tool cost control and process cost calculations.

Use Leitz Tool Management, according to requirements and complexity in different stages.

Leitz Tool Management Logistics

Logistics includes IT supported tool management process with Kanban- or consignment store. One of the special features is the access via internet for the customer and Leitz to a common data base. Invoicing is based on either a stock receipt or stock requisition.

Your advantages:
- Increased production reliability
- Detailed stock information
- Simple ordering process
- Cost optimisation

Leitz Tool Management Life

Life includes invoicing per service cycle and corresponding tool usage.
This means a direct link between production quantities and tooling costs.

Your advantages:
– No capital commitment for tools
– Very low indirect tool procurement costs
– Tool costs correlate with the production quantity
– High machine availability
– History for each tool

Leitz Tool Management CompleteCare

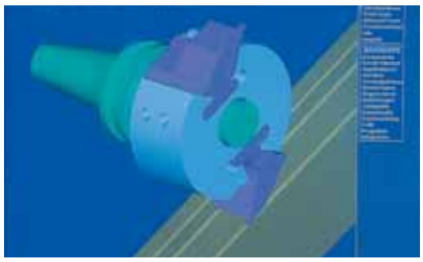

CompleteCare includes the complete package for the whole tool supply from one source. Standardised requirements in high-volume production and invoicing based on per unit produced.

CompleteCare – a package with precise costs so you can concentrate on your core business. Leitz would like to show you our skill in optimising your processes. It's a fact, tooling costs account for less than 1 % of your total costs, but not having the tools available can have a dramatic impact on costs, and these costs are much higher than those of the tools.

Your advantages:
– Continuous cost per invoicing period
– Fixed tool costing for the produced product
– Variable tooling costs based on production volume
– Process optimization and continuous technological improvement

CompleteCare is not a short term project but a long-term partnership offering mutual benefits. Many customers worldwide already have positive experience with CompleteCare and benefit from a partnership with us.

Every day our engineers and technicians are faced with varying production challenges. To help you meet these and be competitive in the future, we can show you how to optimise and achieve economic processing solutions. We offer you this service either on projects, specific applications or complete production processes. Of course at all times confidentiality is guaranteed, and the solutions are designed to meet your needs and requirements.

Leitz has the know-how and our engineers make for you proposals for cost and quality improvements.

We will also help raise your employees level of knowledge. Training and training workshops give you and your employees information on the latest developments in woodworking technology.
Ask us for our support!

Charges exclude travelling and consultancy costs.

Products and technologies are becoming ever more alike because of the nature of work. Developing competitive advantages today depends more and more on knowledge and motivated employees.

Even so high-tech tools will only perform at their best if used and set up correctly. Part of the Leitz Service program is educating and training customers and their employees in tooling and tooling applications. Training can either be at Leitz or in-house.

In addition to basic information on the technical, design and metallurgical characteristics of tools, advice is given on their suitability for specific applications. Information is also given on expected performance, comparison with other types of tools and cutting materials plus instruction on how to handle and maintain tools.

Many benefits come from the operator training program. It helps them control and monitor the process conditions and parameters, identify factors detrimental to performance and faults that may arise in the process.

There's much work in commissioning a new production line – the investment has been made and you want the return on that investment as quickly as possible.

Tools play a significant part in the success of the project.

Here Leitz Service can play its part. We will have already supported you when we designed the tools and when the product or production line was run for the first time. This way we ensure you achieve your performance expectations.

You deserve only the best.

Profiling with Leitz: The perfect solution for every application

The market requirements for profile tool systems are diverse. On one hand, high numbers of the same parts, on the other small batches of customised products. A company cannot be expected to have a complete tool set for each profile, even less if the tool service life exceeds the life of the profile. The right tools are needed for efficient production. Whether windows, doors, furniture boards or panels – Leitz provides you with the perfect solution for every application.

ProFix-Plus

The high-performance profile tool system for industrial applications. Lowest operating costs for high volumes. Can be resharpened with constant profile and constant diameter. Highly precise repeatable process, hence no adjustment after knife replacement.

ProFix F

Combination with planing cutterhead. Free choice of axial position. Multi-purpose tool body.

ProFix C

Complementing the resharpenable ProFix-Plus constant tool system for slot and tenon joints and as counter profiles.

ProfilCut Q, ProfilCut Q Premium

Multi-functional profile tool system for a perfect finish. Standardised clamping system for profile and turnblade knives.

ProfilCut Q Diamond

Combination of an aluminium tool body and resharpenable diamond profile knives with constant diameter.

ProfilCut-Plus

Sharpenable version of ProfilCut, but not constant in profile or diameter.

VariForm

Modular profile tool system for all applications with excellent value-for-money-ratio. For prototype, individual or small series production.

PowerKnifeSystem (PKS®)

The compatible tungsten carbide knife system for multi-purpose cutterheads with serrated back knives.

More efficient, more powerful, more multi-purpose

ProFix-Plus is unique worldwide. A system leaving nothing to be desired.

Using the same knives in several tool bodies allows production of exactly the same profile on continuous and stationary machines. The possibility to quickly change any profile in one body enables production of repeat profiles on the same line efficiently.

The construction design principle – resharpenable knives yet with the same profile – make tool dimension measurements and machine setting adjustments unnecessary. Production instead of proving.

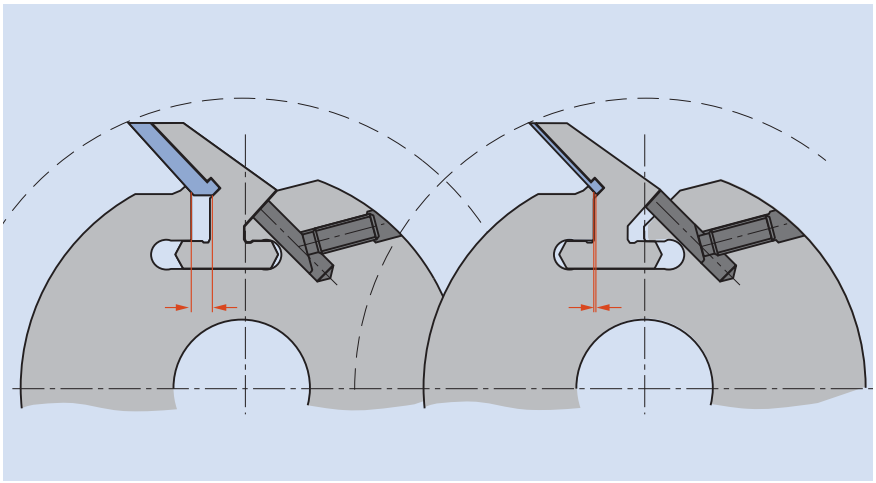

ProFix-Plus is a pace-setting solution of the future. Its system variability offers technical, quality and economic advantages in production of panels, doors, windows, staircases and furniture, and interior and external construction.

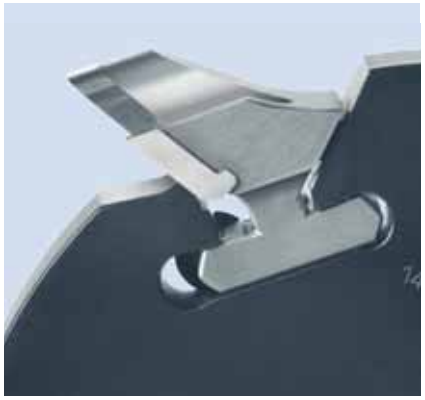

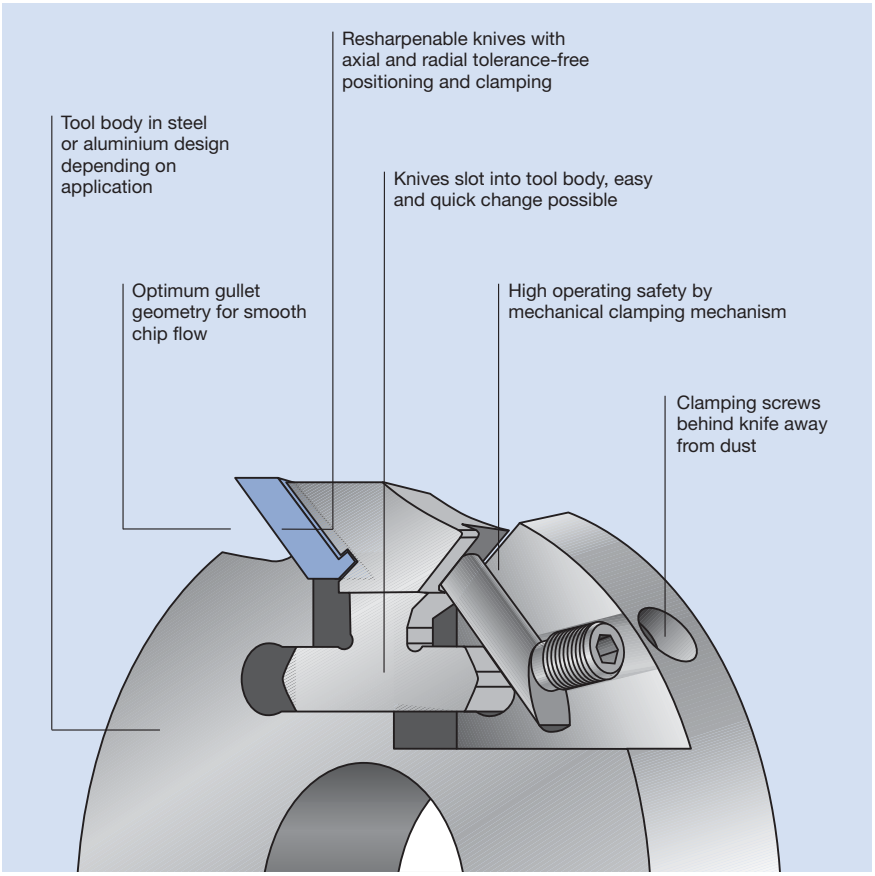

The unique construction design principle

ProFix is different from all other multi-purpose profile tools. Its unique profile and diameter precision are guaranteed, despite repeated sharpening and varying knife thicknesses from the beginning to the end of its life. The patented slot guides the knife to the face stop and is clamped in place when the sharpened knife is inserted into the tool body.

The knives are securely fixed in the tool body T-slot and clamped radially by the centrifugal force.

The exemplary variability…

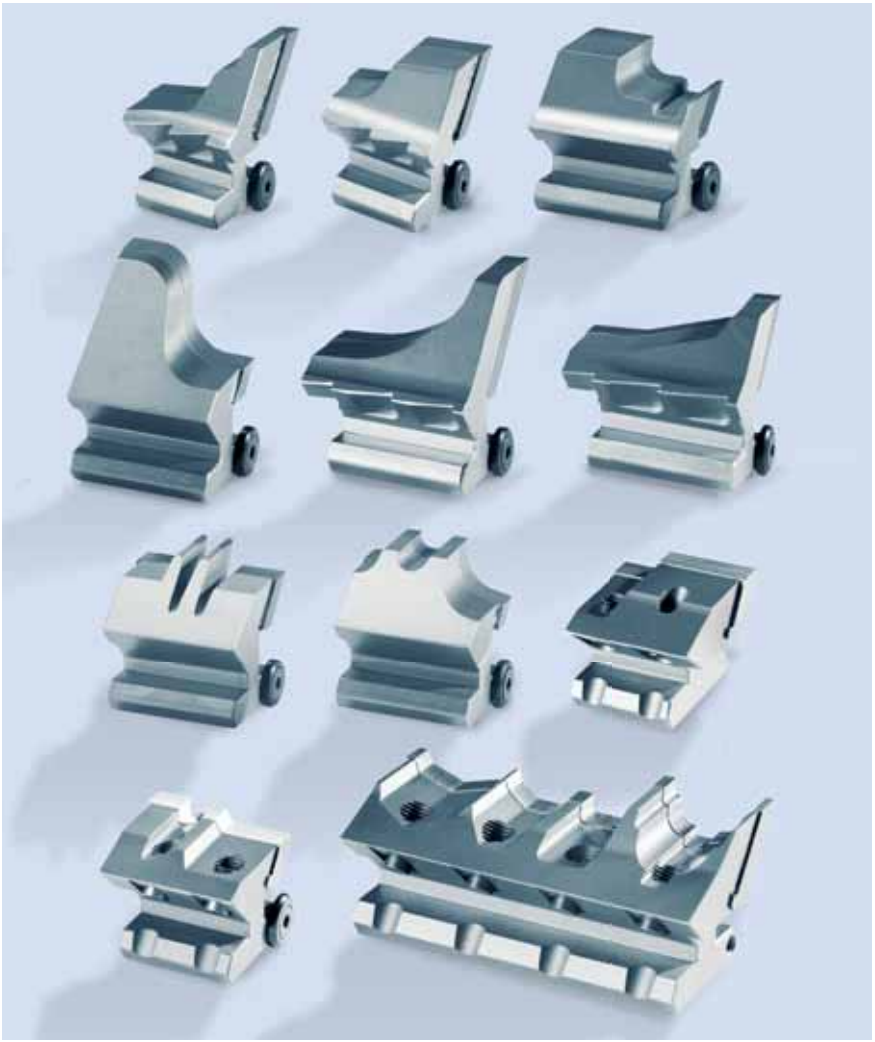

Only a small selection from the wide range of products possible with the modular Profix-Plus system. Same knives with different cutting geometries, used in several tool bodies depending on the type of machine allow for a diversity; no other tool system can offer such high efficiency. The basic principle of technology and multi-purpose and the design spectrum fulfil the customer requirements for cutting geometries and cutting materials matched to the needs of shape and specific materials.

ProFix-Plus enhances the manufacturing options and, at the same time, reduces production processes and set-up times. Last but not least, ProFix-Plus improves the processing quality and increases the overall efficiency.

ProFix knives are available as PF 20 profile depths up to 20 mm, and as PF 25 profile depths up to 25 mm. The cutting widths range from 12 mm to 120 mm. Depending on the application different cutting angles are available:

25° for softwood and cross grain processing
20° for hardwood and mixed wood processing
15° for panel materials and for splintery wood.

…and easy handling

The ProFix-Plus system is characterised by ease of use and product quality!
The advanced ProFix-Plus profile knives give excellent cutting quality. The special Leitz reptile ground finish, with the polished finish cutting face, produces razor-sharp cutting edges.

The knives can be resharpened. No setting gauges or special tools are required to change the knives. Machine corrections, usually necessary after resharpening, are a thing of the past. ProFix operators do not need a projector to measure the tools. Test pieces to check the workpiece dimensions are no longer necessary. Production instead of proving.

Loosen the clamping screw, remove and re-insert the knife. Tighten the clamping screw – the knife change is completed quickly and precisely.

The ProFix-Plus knife for profile depths of 20 and 25 mm. Reptile ground finish and mirror finish cutting face result in razor-sharp cutting edges.

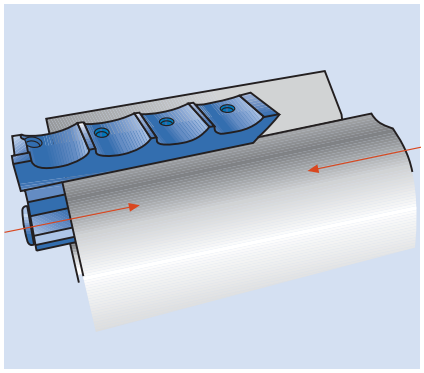

ProFix F – for greater flexibility

The supplement F means increased flexibility. New ProFix profile knives in different tungsten carbide qualities allow for varying cutting widths up to 100 mm in one tool body. Moreover, the profile knives can be positioned any place on the tool body. The profile construction based on a constant zero diameter reduces machine set-up after profile change.

ProFix F is the perfect solution for any four-sided moulder applications, double-ending tenoner or stationary overhead routers with frequently profile changes.

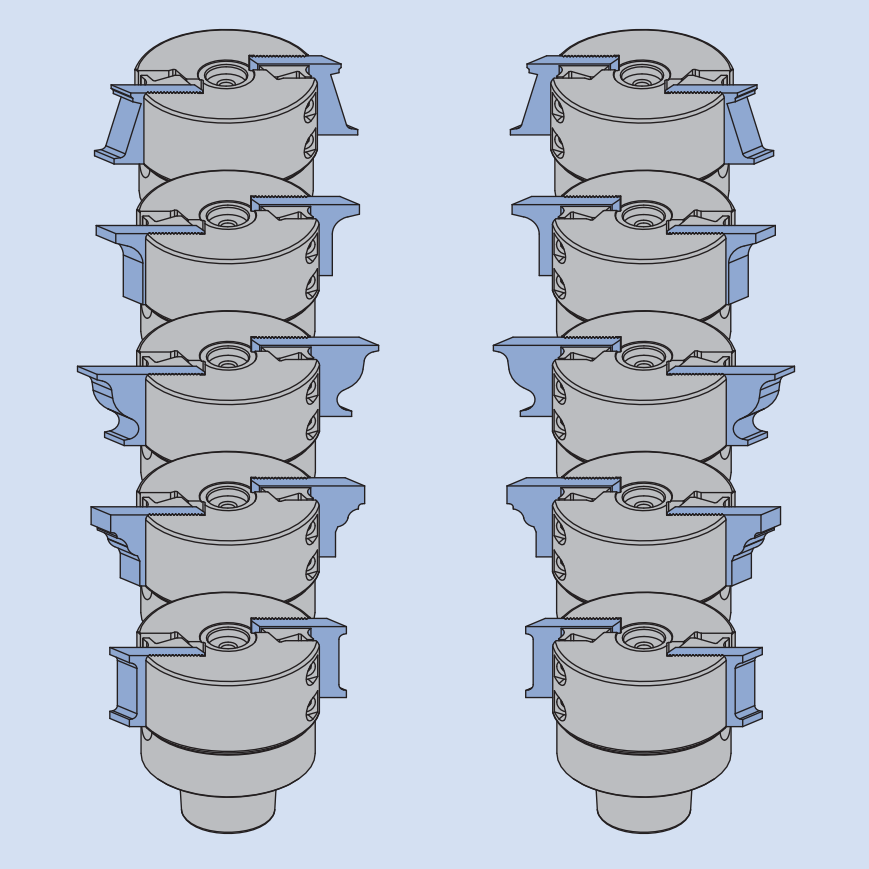

Knife insertion in the machine possible from left or right.

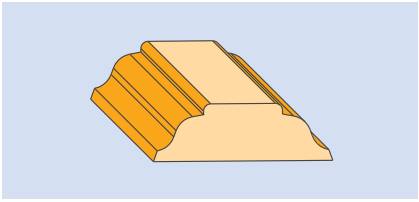

ProFix F incorporates a VariPlan moulding cutterhead, e.g. of manufacturing door frames of different widths etc.

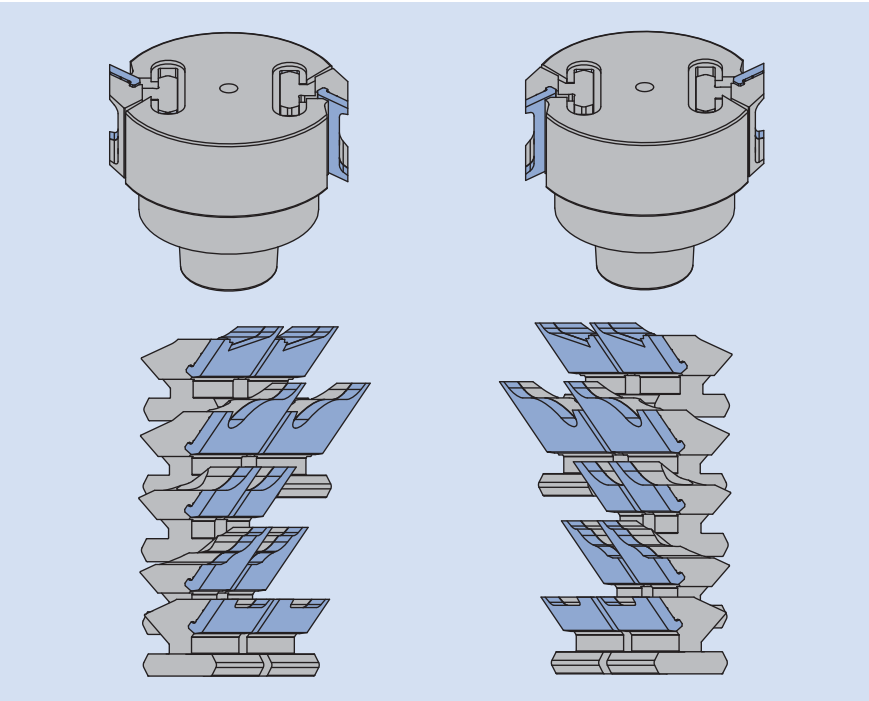

ProFix reduces the tool changer

Compared to conventional profile cutterheads made to a unique profile, ProFix reduces the number of tools in the magazine. Only profile knives instead of complete tools are required. The design allows for precise profile replacement in the tool without set-up or measuring.

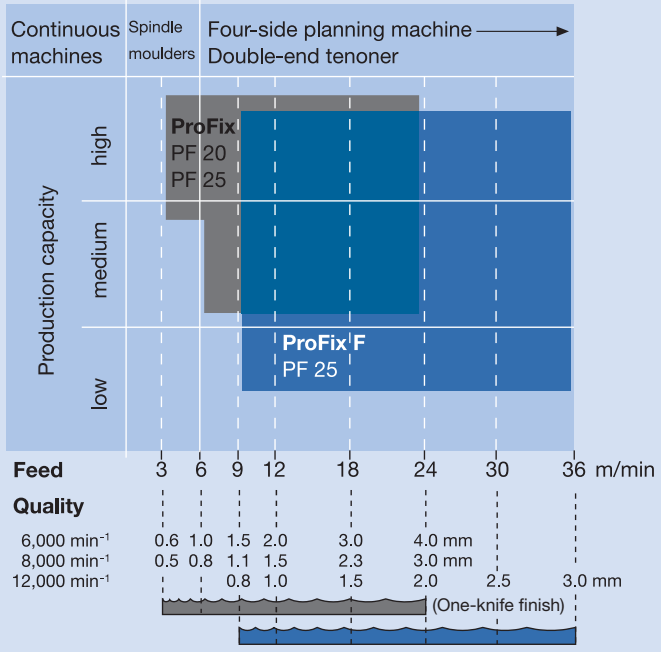

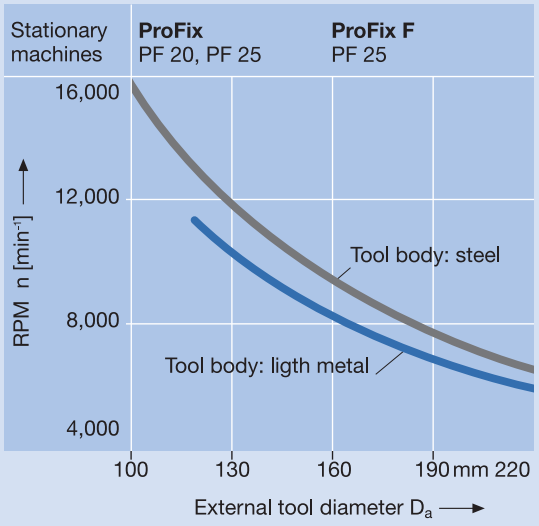

Example strip production:
Stockage of ProFix profile knives instead of complete profile tools.

ProFix-Plus Overview

Performance data		ProFix PF 20		ProFix PF 25	ProFix F
	Unit	Tools with shank	Tools with bore	Tools with bore	Tools with bore
Profile depth max.	mm	20	20	25	25
Cutting width min./max.	mm	12-45	12-80	12-100	20-100
Sharpening range	mm	4	4	5	5
Cutting speed max.					
– steel tool body	m/s	80	80	80	80
– aluminium tool body	m/s	–	70	70	70
Concentricity	mm	0.05	0.05	0.05	0.05
Cutting angle min./max.		15°-25°	15°-25°	15°-25°	15°-25°
Shear angle from/to		0°	0°-20°	0°-25°	0°
Side relief angle		0°	0°	0°	0°
Angular knife seating		–	8°	8°	–

Applications

For processing all common materials, including solid wood, panels and compound materials, as well as complete synthetic materials.

For producing panels, furniture, doors, windows and staircases interior and external construction.

On all machines, CNC overhead routers and machining centres, four-sided moulders, hydro moulders, double-end tenoners.

Special features

Only multi-purpose tool system with resharpenable profile knives and guaranteed profile and diameter constancy.

Repeatable profile manufacture without tool measurement, test cutting or machine adjustment.

High overall efficiency.

The conclusive efficiency …

The diagram shows the efficiency of the ProFix-Plus system compared with conventional profile tools without resharpening. Basic features of both tool system are a diameter of 180 mm, a cutting width of 40 mm and 4 knives.

Whilst the conventional profile tools requires 15 replacement tips, ProFix can sharpen fifteen times in the same period. The minimum thickness of the ProFix-Plus knives is generally reached only after the fifteenth sharpening when a new set of knives are required.

The comparison confirmed in practice, shows a cost reduction of 30 %. Given the increasing competition and pressure on costs, this represents an economic advantage clearly attributed to ProFix-Plus.

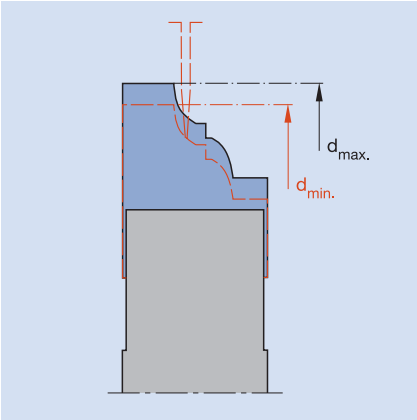

ProFix-Plus tool body
ProFix-Plus Sharpened knives
ProFix-Plus sharpening

Profile cutterhead
Replacement profile tips

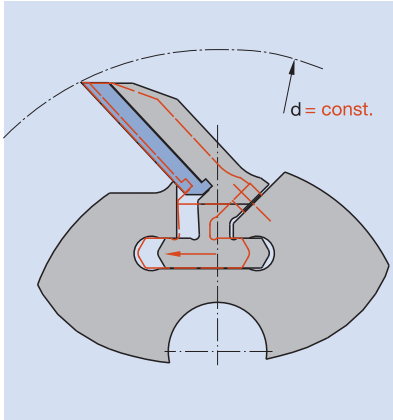

Development of tool costs by time

Reduction in set-up time with ProFix-Plus by measurement constancy

Conventional profile cutterheads change in profile and diameter after every resharpening
– unproductive set-up time
– Adjustment of spindles
– Test pieces

ProFix-Plus constant tools with memo function for profile and diameter
– measurement constancy for entire service life
– no tool measurement
– production without test pieces

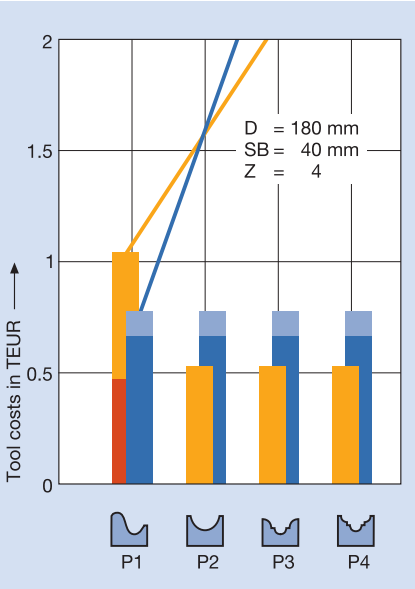

Relation of the profile diversity to the tool costs

The same efficiency is achieved by comparing the cost subject to increasing profile diversity. If different profiles are manufactured frequently, not only different knives, but different tool bodies are required for conventional profile tools. This results in significantly higher costs of conventional systems. Already after three different profiles, the investment savings clearly speak in favour of ProFix-Plus and against conventional tools.

… and the environmental compatibility

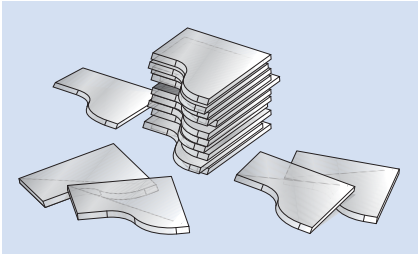

Last but not least, a comment on the environmental impact. The consumption of high-quality cutting material used in conventional, non-resharpenable tool systems is seven times higher than ProFix-Plus.

And, moreover, if a new tool body is required for each new, non-resharpenable profile, demand for steel or aluminium material increases.

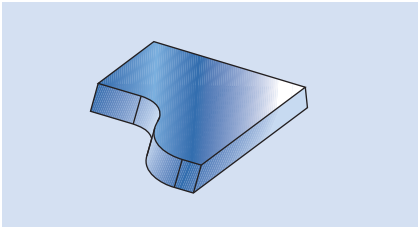

ProFix-Plus tool body
ProFix-Plus resharpenable knives

Profile cutterhead
Throw-away profile knife

16 conventional knife sets
(Z 4) = 3.6 kg

1 ProFix-Plus knife set (Z 4) = 0.54 kg

All-out efficient!

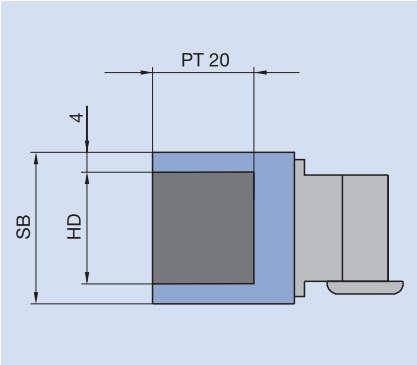

ProFix is combinable with the throw-away knife system ProfilCut. From this result unbeatable advantages e.g. in the window production:
Main profiles with high production quantity or profile areas within a tool which require design freedom, are designed in ProFix. Low-importance profiles with low production quantity are designed in ProfilCut. Thus you don't have to make any compromises regarding to the efficiency.

Application information

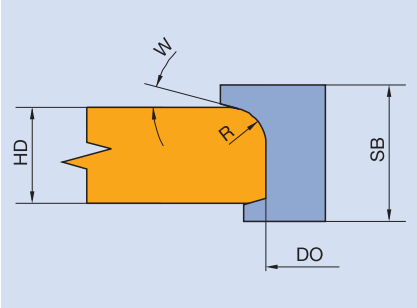

Example: Usable profile area of ProFix PF 20

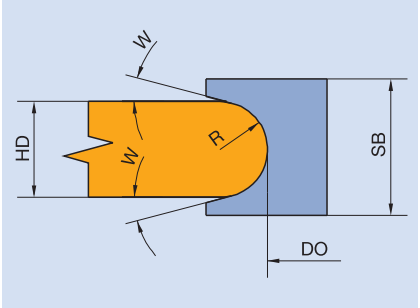

Cutting angle

The cutting angle is chosen depending on the machining requirements and the material to be processed.
Cutting angle 25° for softwood.
Cutting angle 20° for hardwood.
Cutting angle 15° for panel materials.

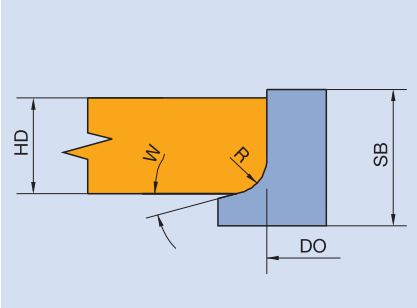

Shear angle (chip clearance relief)

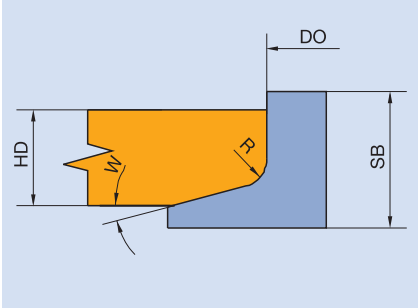

0° shear angle for all closed profiles such as e.g. round profiles, profile relief at least 10°.

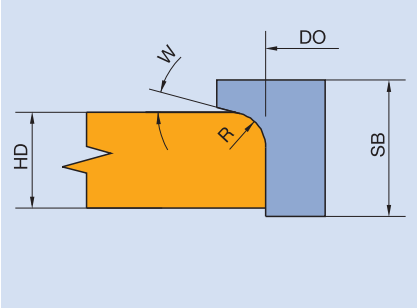

With shear angle top cutting first

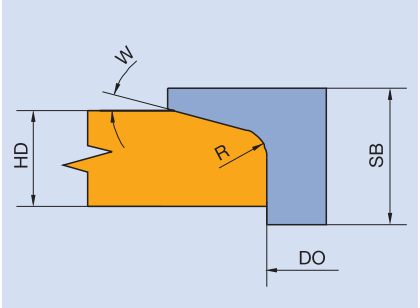

Shear angle top or bottom cutting first for all profiles open on one side with straight jointing edge and profile relief of at least 10°.

With shear angle bottom cutting first

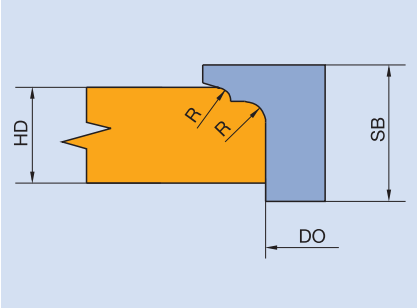

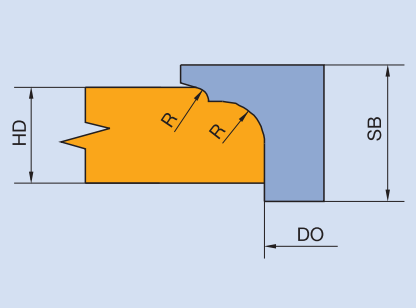

Knife seating 8° inclined, bottom cutting

Shear angle and knife seating 8° inclined for all profiles without profile relief.

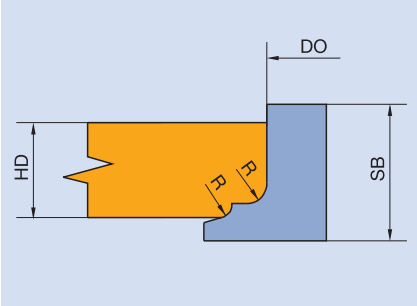

Please note:
ProFix knives do not have a radial lateral clearance angle! The knives are mounted in an inclined position for profiles without lateral profile relief. For closed profiles without profile relief the knives are mounted inclined alternately at the top and at the bottom.

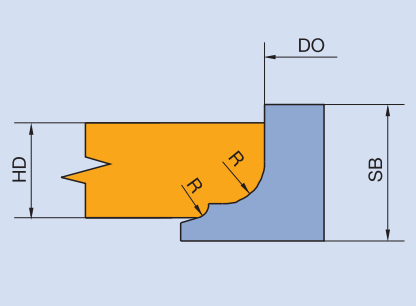

One tool in Z 2 has Z 2 + 2, i.e. 4 knives on the tool periphery.

Knife seating 8° inclined, top cutting

Minimum zero diameter depending on Z 2 – Z 10

number of teeth	PF 20 with shank	PF 20	PF 25	ProFix S	ProFix F
Z 2	56 mm	80 mm	116 mm	160 mm	100 mm
Z 3		80 mm	116 mm	160 mm	100 mm
Z 4		95 mm	128 mm	160 mm	125 mm
Z 6		150 mm	180 mm	180 mm	170 mm
Z 8		240 mm	300 mm	300 mm	210 mm
Z 10		–	–	–	245 mm

The table applies for one-part tools.
The number of teeth corresponds to the cutting edges mounted in the tool.

Minimum zero diameter depending on the tool body bore

bore BO	PF 20	PF 25	ProFix S	ProFix F
20	80 mm	116 mm	160 mm	100 mm
25	90 mm	116 mm	160 mm	105 mm
30	95 mm	116 mm	160 mm	110 mm
40	105 mm	116 mm	160 mm	116 mm
50	120 mm	128 mm	160 mm	128 mm
60	130 mm	140 mm	160 mm	140 mm

Note: The larger of the two diameters indicated in the two tables must be used.

ProFix C for counter and slot/tenon profiling

An extension to the ProFix constant tool system specially for window construction for slot : tenon and profile : counter profile joints.

The increasing popularity of profile splitting in modern window construction requires tools with constant diameters and constant profiles. As one tool is not used as frequently as another, the tools need to be refurbished at different times. In conventional window constructions with fixed tool sets, a constant slot width helps to ensure a durable long-term joint. Conventional resharpenable tools have the downside of changing diameters and profile widths. This means the machines need to be reprogrammed.

Throwaway knives are often seen as the way out of this dilemma. The new Leitz ProFix C tool system for making slot-tenon and counter profile joints is more beneficial to the resources and budget. ProFix C is resharpenable without any change in dimensions. It offers the trusted advantages of the ProFix-Plus constant tool and completes the system for all steps to profiling in wooden windows and doors.

ProFix C System benefits

– Constant cutting diameter and constant profile after resharpening
– Large hook and shear angles – ideal for cross grain
– Optimised gullets for large slotting depths
– Knife cutting widths 8 to 20 mm
– Slotting width ≥ 10 mm without spurs
– Other slotting widths possible by exchanging the knives
– Knives can be profiled – profile depth up to 12 mm
– All knife types can be supplied in RipTec design
– HW qualities for all wood types
– HW edge can be resharpened 10 to 12 times
– Used knives can be re-tipped
– Tool body can be supplied in steel or optionally in aluminium
– High rotational speeds for high production

ProFix C Standardisation

– Three basic types of knife seatings cover all application cases
– Modular structure with standardised knife types enables a tool structure matching the profile and direction of wood fibre

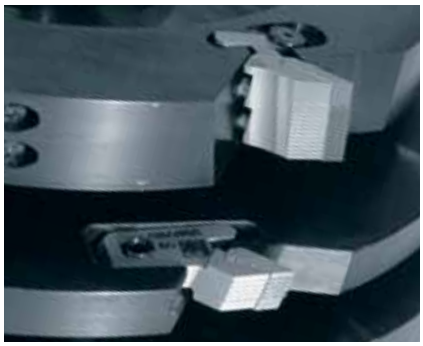

With shear angle and lateral clearance angle.

With advanced shear angle outside.

Profile knife with advanced shear angle inside.

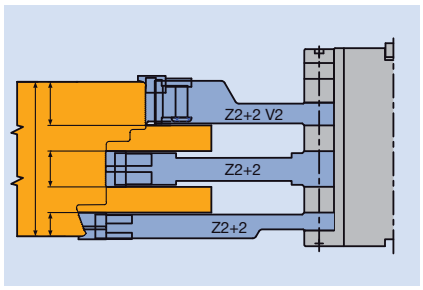

Combination of ProFix and ProFix C knives in the same tool.
Example: Knives with RipTec profile for improved joints.

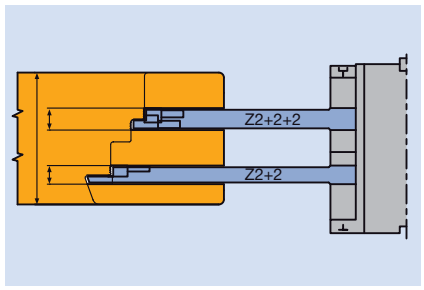

Application example ProFix C „frame tenon for top of jambs“: Cutting edges in RipTec design for improved quality of cut in cross grain.
Combination of ProFix knives for large cutting widths in the rail area.

Application example ProFix C „frame slot-cross“: Slot widths from 8 to 20 mm. No spurs are required for slot widths of 10 mm.

For a better performance – the system with an unbeatable variety

When cutting quality matters, the cutter head system ProfilCut Q is setting the standard. It exceeds all expectations, even for the most extraordinary profiling requirements. ProfilCut Q delivers precision results whether in the bespoke or industrial manufacturing of windows, doors or furniture production. With many possible applications and its guarantee of reliability, companies can increase profitability and take the lead in their market sectors.

ProfilCut Q has a diameter range from 0 to 650 mm. The uniform clamping system is designed for exchangeable knives and turnblades. Its light weight is a big advantage of the system.

With a lightweight aluminium supporting body, its effectiveness at high cutting speed is always guaranteed.

The knives are positioned form-fitting in the centrifugal force direction. The tightening of the clamping screws automatically secures an axial and radial centering, resulting in a zero-tolerance fitting. ProfilCut Q is a technical innovation which delivers substantially enhanced surface-quality and reduction of rejects and rework. Matching the profile, the clamping wedges and the guiding elements conduct chip removal, which contributes to a perfect finish.

The special circular tool design with its rounded edges reduces noise. The wear parts of ProfilCut Q are built in steel. The balancing of ProfilCut Q is effectively limiting vibrations, protecting the spindle bearings and leads to a better surface-quality and prolonged performance times.

More profitability

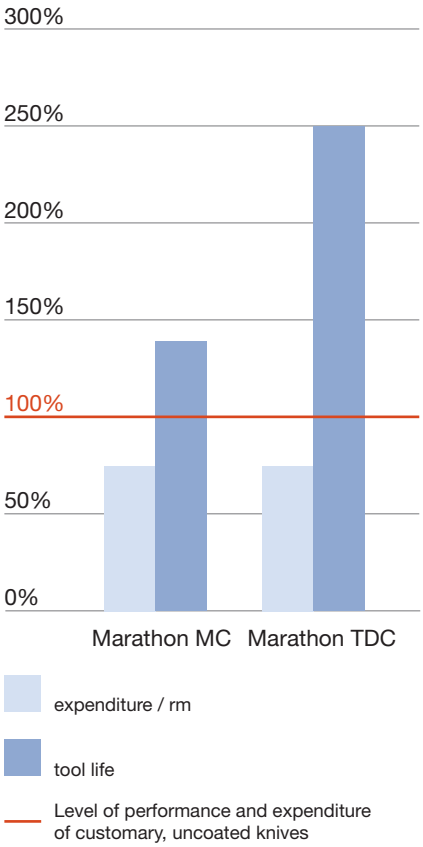

Limited production expenditures due to
– longer tool life by Marathon high power coating
– reduced maintenance
– less machine down time
– economy by combining standard straight and profiled throwaway knives

More quality

Minimum rejects, less rework and machined surfaces to finish quality by
– extra-sharp cutting edges by polished face
– innovative coating-technology for longer performance and cut quality
– balanced to prevent vibration, therefore an enhanced cut quality surface finish

More usability

Short set-up times combined with user friendliness due to
– automatic knife adjustment without setting gauges
– changing the knives while the tool is in the machine is possible
– lightweight construction of the tool body
– clamping screws are dust-protected
– perfect repetition accuracy, after every knife change
– noise reducing design

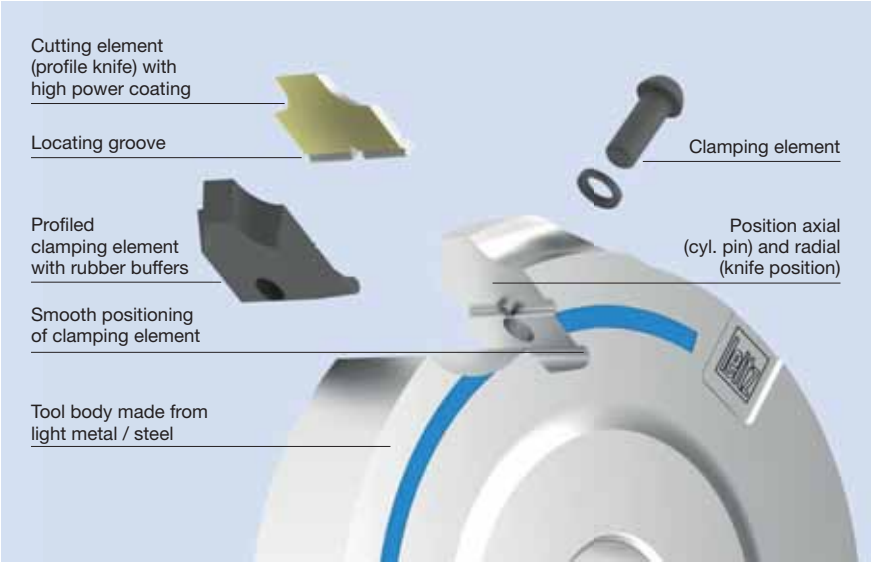

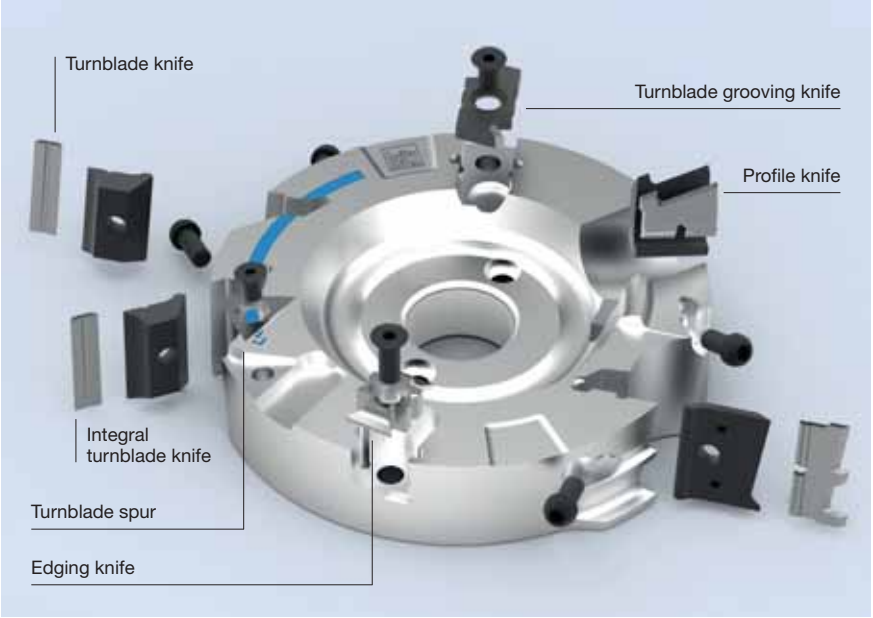

Technical specifications

Radius	Shank tool 0-400 mm Tools with bore 70-650 mm
Cutting width	8-80 mm ProfilCut Q 8-120 mm Turnblade knife
Closed profiles	Z 2, from zero diameter 60 mm max. number of teeth depends on diameter
Tool body	Aluminium / steel
Number of teeth	Single-sided profiles: Z 1, up to zero diameter to 40 mm Z 1/1, from zero diameter to 40 mm
Profile depth	PD max. 20 mm (straight tool body) PD > 20 mm (cranked tool body)

For special surface quality demands, we recommend splitting the cutting edge (2-part design instead of a 1-part design - independent of the cutting width).

Example for possible turnblade and throwaway knives combination

Application overview

Profile

- Window profiles
- Slot and tenon profiles
- Interior and exterior profiles
- Glue joint profiles
- Panel raising profiles
- Post- and Softforming profiles
- etc.

Machining processes

For every profiling tasks in small, medium-sized and large-scale production with a cutting speed (v_c) up to 90 m/s.

Machine types

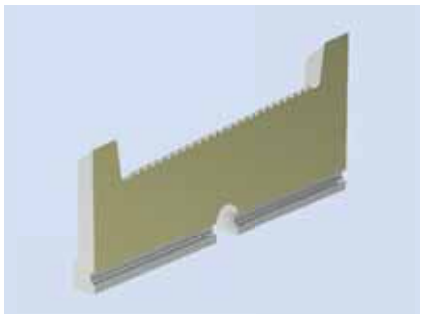

For all conventional cutting machines with manual feed (MAN) or mechanical feed (MEC).

Materials

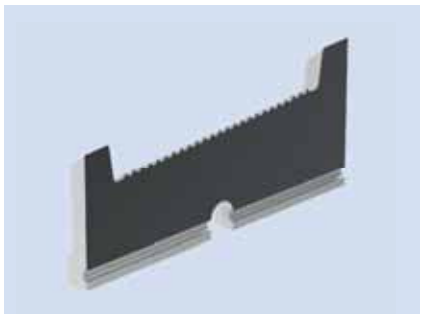

- Hardwoods and softwoods
- Wood derived materials such as: plywood, fibreboard, block board and chipboard
- Polymers such as: Duro- and Thermoplastics, laminated wood based panels as well as composite materials and aluminium

Coating

Marathon MC (Multicoating) for demanding profiling tasks. Marathon TDC (Tungsten Diamond Coating) for the processing of hardwoods, abrasive materials and for large scale production.

Marathon MC-coating – highest quality for soft woods.

Marathon TDC-coating – specialist for hard woods and abrasive materials.

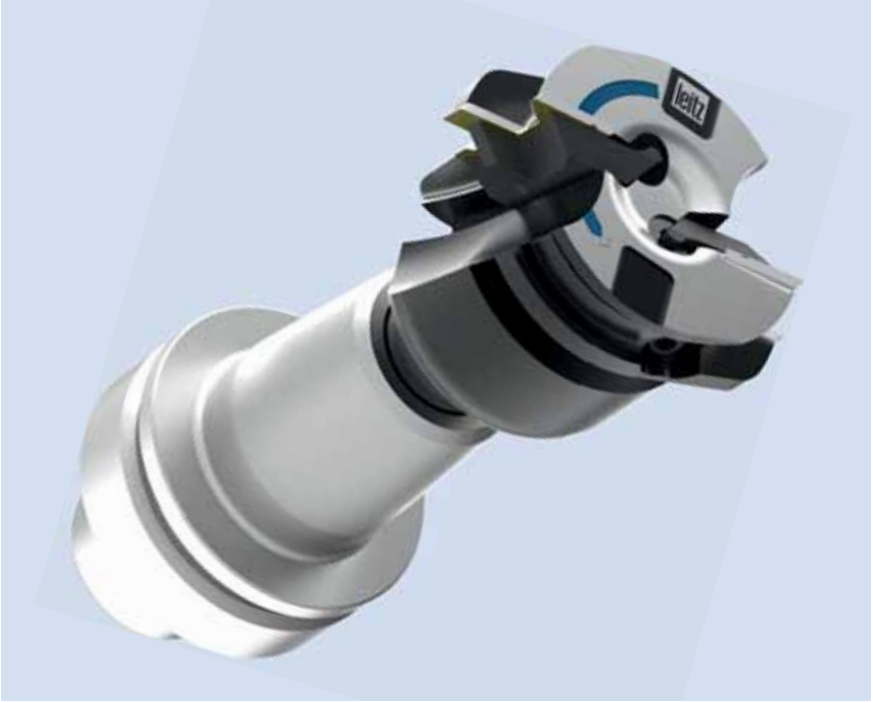

Extraordinary performance – more quality and quantity with every cut

The new ProfilCut Q Premium cutter head system from Leitz is the ultimate solution for companies who want to make the most from their production. With its unique tool design, ProfilCut Q Premium is the benchmark for performance, flexibility, handling, weight and durability, and manufacturing companies can rely on its extraordinary performance.

With a cutting speed up to 120 meters per second, the premium system is faster than any comparable tool, both in productivity and surface quality. Its accelerated process performance saves time and money.

The integration of Leitz technical innovations create a new standard. The latest clamping system has been designed for the highest radial speed and the unique surface coating reduces abrasion, dirt adhesion and heat build-up even more effectively. The lightweight design of the tool body maintains a greater dynamic. Additionally, changing knives is simple, fast and accurate.

A unified clamping system guarantees safe, form-fitting clamping and minimal set-up time. The knives are positioned in the centrifugal force direction. The special clamping wedges have the additional function as chip-guiding elements. This technical feature enables chip generation with reduced dust which consequently helps lead to a perfect finish. With the special contouring of the tool body, noise pollution is also reduced effectively.

More speed

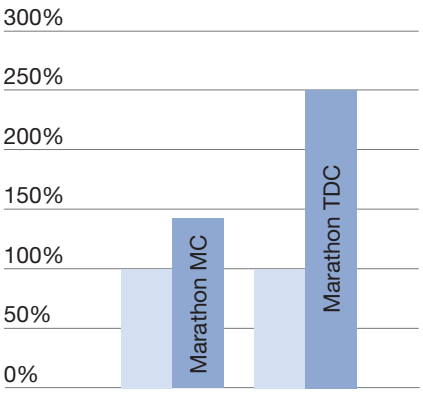

Maximise productivity by the reduction of processing time and a significantly better surface quality due to
– innovative and secure clamping system
– unique tool body coating reduces heat generation and friction
– lightweight construction of the tool body

More usability

Short set-up times and best usability due to
– automatic knife adjustment without setting gauges
– changing the knives while the tool is in the machine is possible
– clamping screws are dust-protected
– perfect repetition accuracy, after every knife change
– noise reducing design

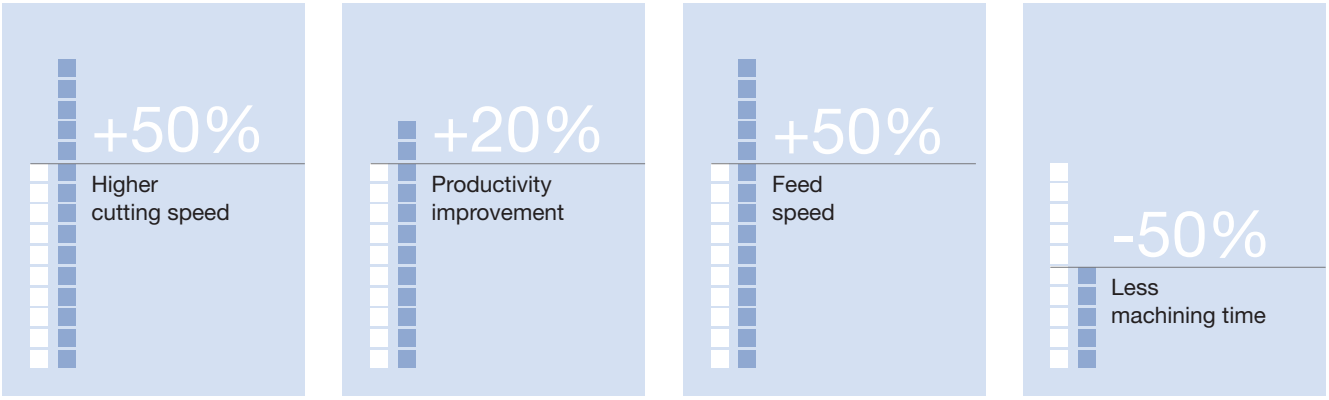

More endurance

Longer finish cutting quality due to
– knives with Marathon high power coating
– innovative coating technology for longer performance and cut quality
– balanced to prevent vibration, therefore an enhanced cut quality surface finish

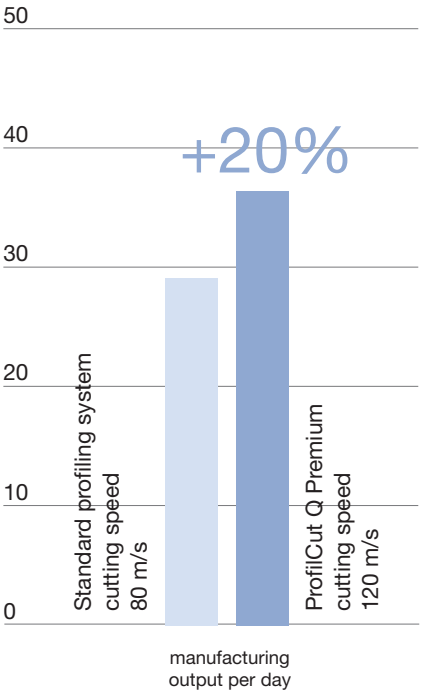

More profit at all levels

Typical production sample:

- manufacturing output 30 windows per day
- average cutting time 42 % per window
- comparison from an average profile tooling system with Leitz ProfilCut Q Premium

Application overview

Profile

- Window profiles
- Slot and tenon profiles
- Interior and exterior profiles
- Glue joint profiles
- Panel raising profiles
- Post- and Softforming profiles
- etc.

Machining processes

For every profiling tasks in small, medium-sized and large-scale production with extremely high cutting speeds (v_c) up to 120 m/s.

Machine types

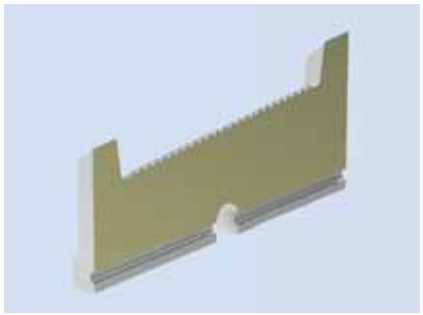

For all conventional milling machines with manual feed (MAN) and with mechanical feed (MEC). Particularly suitable for all high-performance machines in stationary technology and for systems with high part ejection or high tool performance.

Materials

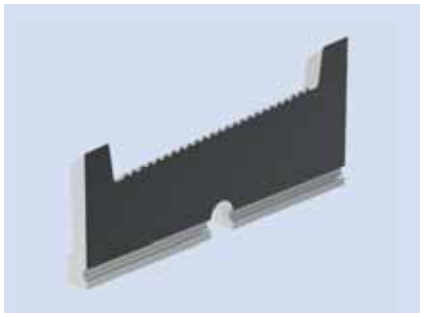

- Hardwoods and softwoods
- Wood derived materials such as: plywood, fibreboard, block board and chipboard
- Polymers such as: Duro- and Thermoplastics, laminated wood based panels as well as composite materials and aluminium

Coating

Marathon MC (Multicoating) for demanding profiling tasks. Marathon TDC (Tungsten Diamond Coating) for the processing of hardwoods, abrasive materials and for large scale production.

Marathon MC-coating – highest quality for soft woods.

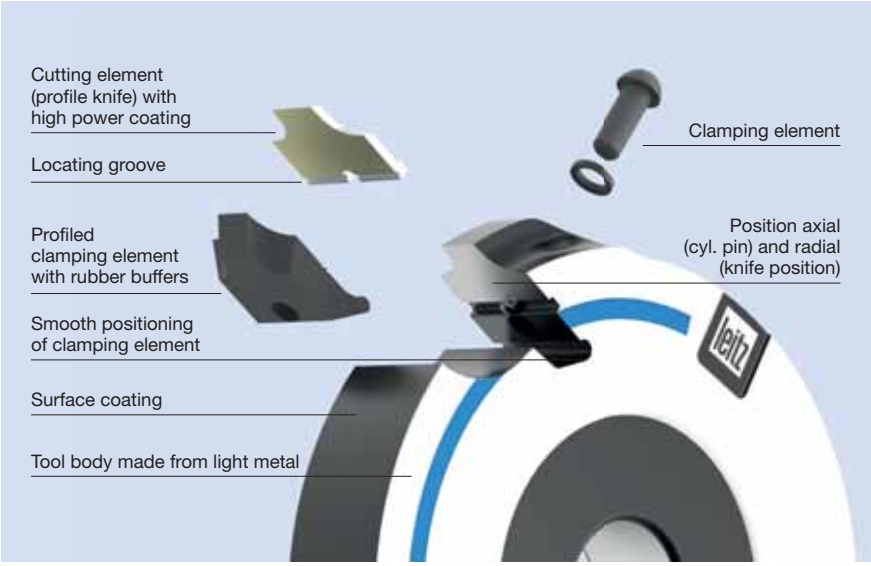

Marathon TDC-coating – specialist for hard woods and abrasive materials.

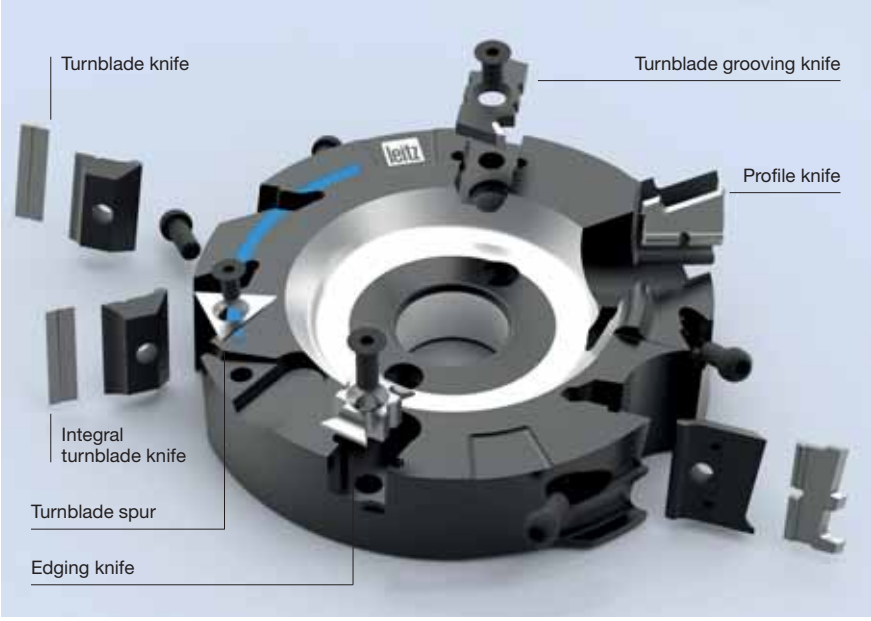

Technical specifications

Radius	Shank tool 0-400 mm Tools with bore 70-650 mm
Cutting width	8-80 mm ProfilCut Q Premium 8-120 mm Turnblade knife
Closed profiles	Z 2, from zero diameter 60 mm max. number of teeth depends on diameter
Tool body	Aluminium / steel
Number of teeth	Single-sided profiles: Z 1, up to zero diameter to 40 mm Z 1/1, from zero diameter to 40 mm
Profile depth	PD max. 20 mm (straight tool body) PD > 20 mm (cranked tool body)

For special surface quality demands, we recommend splitting the cutting edge (2-part design instead of a 1-part design - independent of the cutting width).

Example for possible turnblade and throwaway knives combination

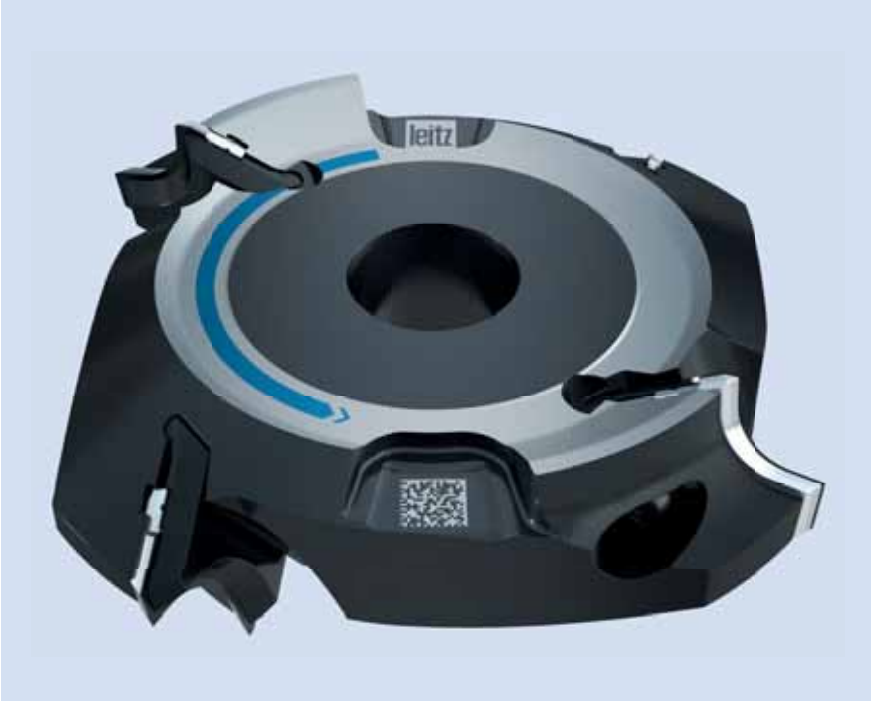

ProfilCut Q Diamond – Diamond in a new dimension

The new replaceable knife system ProfilCut Q Diamond sets pioneering new standards in machine processing. ProfilCut Q Diamond is a unique combination of an ultralight aluminium tool body and re-sharpenable profile knives. This enables constant diameter diamond cutting, guaranteeing higher efficiency and maximum productivity and profitability.

This advanced technical innovation begins with a new diamond cutting edge made from the hardest material on earth: polycrystalline diamond (PKD). Process high-end and abrasive materials precisely with exact repeatability and no loss of performance. After sharpening, the diameter and profile of the cutting edge remains unchanged. ProfilCut Q Diamond can be sharpened five times, and with a service life many times longer than disposable carbide systems, ProfilCut Q Diamond provides significant cost savings.

High performance continues with the dynamics of the tool body's aluminium light-weight construction, and the clamping system has been designed for maximum peripheral speed. The coating effectively reduces impact, friction and heat generation. Even at a maximum rim speed up to 120 meters per second, the system produces first-class surface quality due to reduced vibration. The increased speed also allows faster feed rates with the same number of teeth, enabling higher productivity.

Work faster

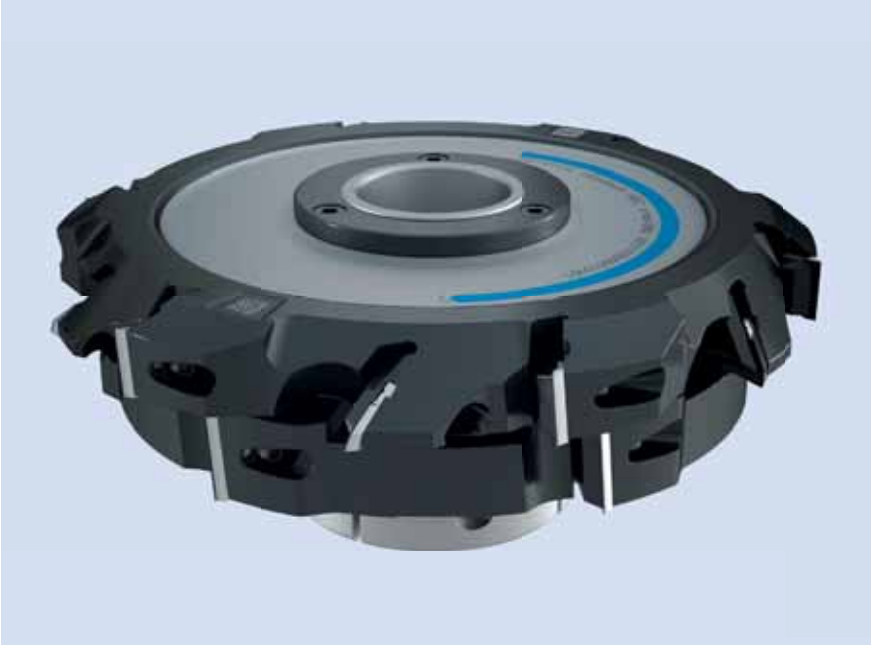

Maximise productivity and reduce processing time by:
– significantly improving surface quality
– innovative clamping system for the toughest applications
– friction and heat reducing coating
– lightweight aluminium construction
– less vibration due to superior balance quality
– Diamond cutting

Easy to use

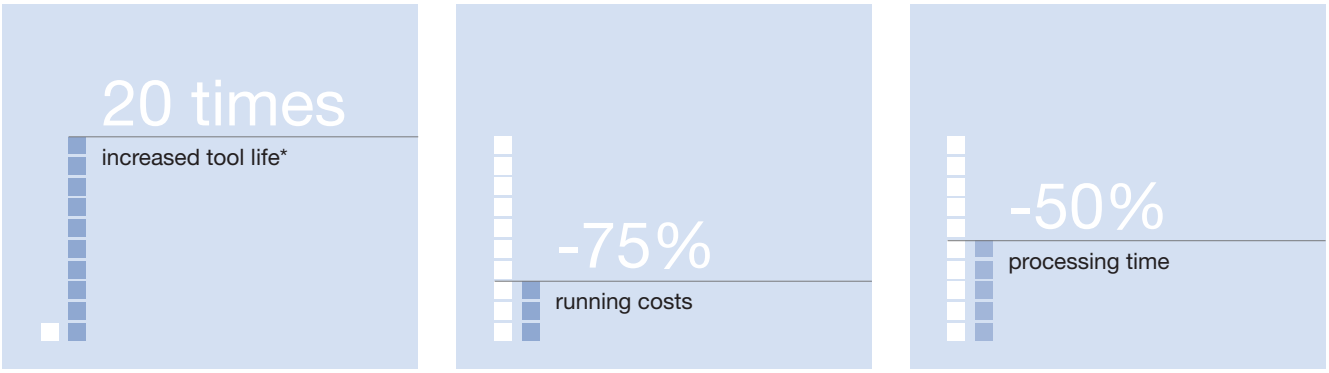

Short set-up times and easy-to-use:
– independent knife positioning without setting aids
– change knives on-site – no need to send the tool to the service centre
– knife change in the mounted set
– perfect repeatability after each knife change
– easy set-up after sharpening
– compatible with all other tooling systems
– noise-reduced design

Sustainable operation

Save on resources, thanks to:
– reusable tool body
– replaceable knives
– resharpen knives five times
– many times longer tool life
– reduced service costs

Impressive performance – specialist for hardware

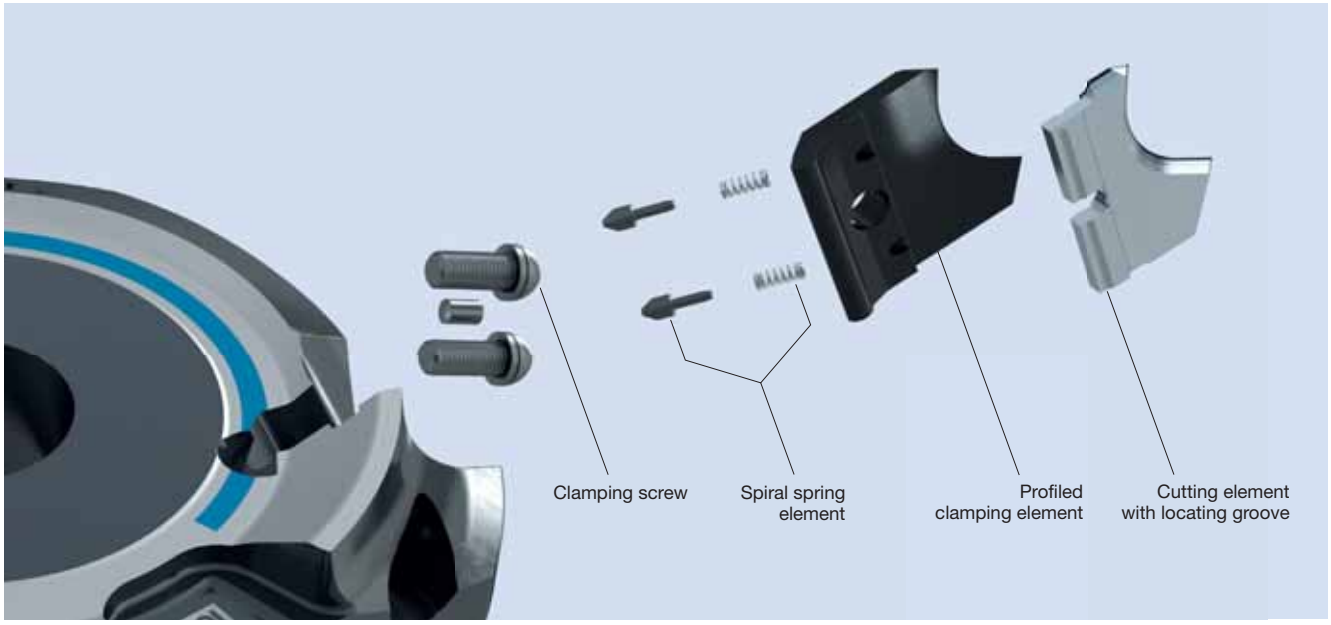

* compared to average carbide tools

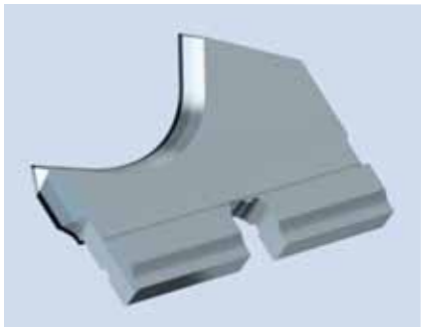

Applications	– Versatile applications using advanced materials – Mouldings – Furniture manufacturing – Aluminium processing – Flooring manufacture – Diverse profiles – Window and door manufacturing with abrasive materials
Machining processes	For all profiling applications in small, medium and large production and manufacturing. Suitable for highspeed cutting (HSC) machining with extremely high rim speeds.
Machine types	For all conventional machines with manual feed (MAN) and mechanical feed (MEC). Particularly suitable for all high-performance CNC processing centres and for systems with high output and/or high tool performance.
Materials	– Particularly effective for applications using advanced materials such as aluminium, fibre reinforced or composite materials – All wood materials (softwood, hardwood, plywood, fibreboard, block board and chipboard) – All plastics (duromers, plastomers, laminate board, thermoplastics, laminated wood based panels as well as composites)

Technical specifications

- resharpen knives five times
- constant profile and diameter
- many times longer tool life
- polycrystalline diamond (PKD) – the hardest material on earth

Rim speed	v_c = 120 m/s
Cutting width	Max. 50 mm to profile depth 15 mm
Datamatrix Code	Product information available
Diamond cutting edge	Resharpen knives five times polycrystalline diamond (PCD)
Lightweight	Combined lightweight construction with diamond cutting edges
Number of teeth	Single-sided profiles: Z 1, up to zero diameter to 45 mm Z 1/1, from zero diameter to 45 mm

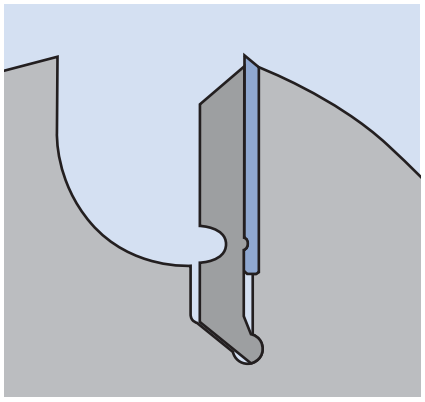

**ProfilCut Plus –
the resharpenable system supplement**

ProfilCut Plus is ideal for producing standard and special profiles, interior and exterior profiles for windows as well as post- and soft-forming profiles. The 0.3 mm sharpening zone allows repeated sharpening. For suitable applications, this considerably increases efficiency compared to a 1-life throwaway knife system.

The elastic deformation of the clamping elements guarantees uniform clamping of the resharpened knife. For safety reasons, resharpenable knives cannot be used in ProfilCut Q or ProfilCut Q Premium cutterheads.

ProfilCut Plus

A system which is both simple and versatile

VariForm – variable and multi-functional

For industrial or manual production: the VariForm tool system offers unique advantages to businesses of all sizes and gives a clear competitive edge to production and quality. Its concept is simple: a flexible tool body design, cost effective as the tools can be resharpened several times, and versatile with numerous knife profiles.

VariForm provides unlimited design opportunities with regard to profile and product form. At the same time it improves the cost effectiveness of your production.

Workpiece materials

Hardwood and softwood, laminated wood, chipboard and fibre material, plastics

Machines

- spindle moulders
- four-sided moulders
- edgebanding and sizing machines
- CNC router cutters and CNC machining centres

Applications

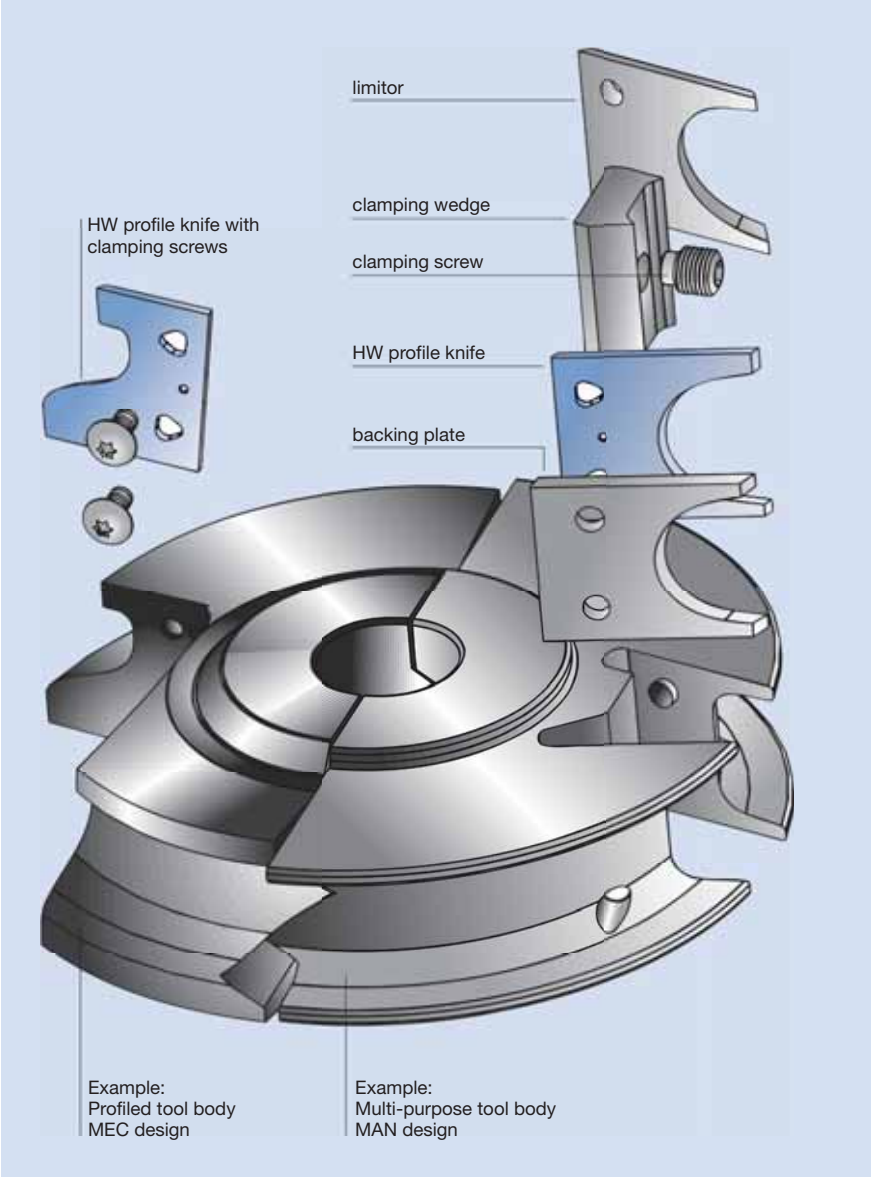

- furniture, mouldings
- prototypes, single pieces
- small and medium series
- etc.

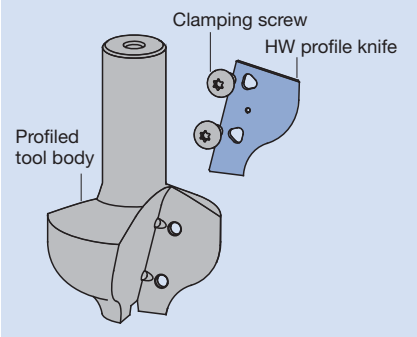

Easy handling

The VariForm knife clamping “overrides centrifugal force”.
3-point support, the knives are centered, clamped and positioned radially by the centrifugal force.
That means no movement at high speeds and precise and safe working at the optimum cutting speed range of 70 to 80 m/s.
Another advantage: As there are no side stops, you can profile the blank knives around the entire periphery.

Note:
Small tool diameters or profile depths exceeding 20 mm require profiled tool bodies.

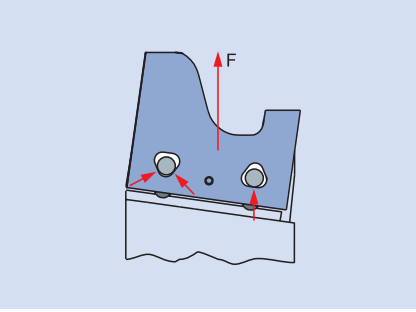

Diagram of the knife clamping.

VariForm – a first-rate tool system – made by Leitz

All advantages at a glance

- Resharpenable three to four times.
- Different HW qualities for solid wood and panel materials.
- The right cutting material for every application.
- Modular system: Use the same profile knife in different tool bodies for different machines, suitable for all popular spindle diameters and for quick-clamping systems.
- Tool body designs adapted to the profile depth for a high degree of design freedom.
- Maximum precision and safety by three-point knife clamping.

And unique customer service as well

Over 120 Leitz service stations respond quickly, expertly and reliably to customer requests. Based on profile drawings or wood samples, special profile knives are produced accurately, quality tested and delivered at short notice to meet the customer deadlines – as standard with Leitz. As we archive the templates, resharpening and replacement are both quick and easy.

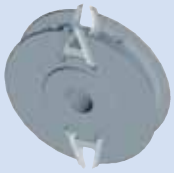

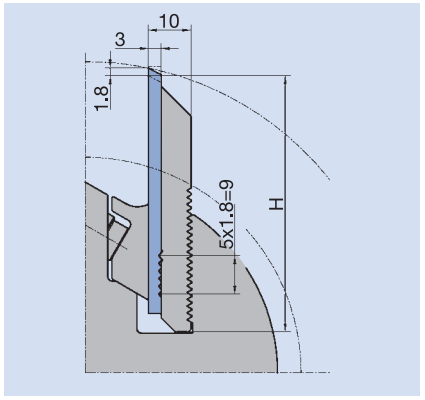

VariForm –
main designs and data at a glance

Design variants	Profile depth up to 15/19 mm	Profile depth up to 20 mm	Profile depth up to 35 mm
MAN feed for spindle moulders	 multi-purpose tool body	 partially profiled tool body, channel	 profiled tool body, cranked ri./le.
Cutting width:	40/45 mm and 50/60 mm	40 mm to 60 mm	40 mm to 60 mm
MEC feed for four-side planing machines, -edgebanding and sizing machines (suitable for quick-clamping systems)		 partially profiled tool body, channel, L profile, I profile	 profiled tool body, cranked ri./le.
Cutting width:		40 mm: L-, I-Profil 40/60 mm: U-Profil	40 mm to 60 mm
MEC feed (CNC) for CNC router cutters and CNC machining centres	 multi-purpose tool body		 profiled tool body, cranked ri./le.
Cutting width:	40/45 mm and 50/60 mm		30 mm to 50 mm

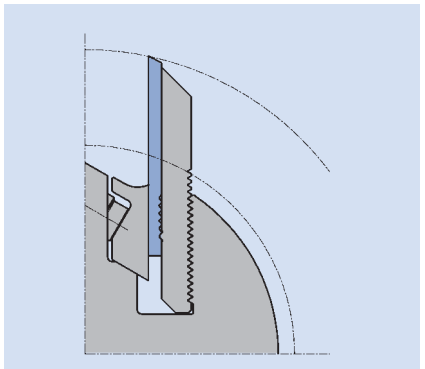

PowerKnife System PKS® Tungsten carbide blank knife with backing plate for serrated back profile cutterheads

PKS®: New condition

PKS®: Resharpen several times, in end position

Manufacturing profiled mouldings is important. Profiled mouldings are used, for example, at floor level as skirting boards, around doors as frame profiles, and in cabinetry as decorative mouldings. Such products are usually manufactured on four-sided moulders on through-feed machines and pose specific requirements on the tool system.

- Profile changes need to be actioned quickly by suppliers. This means the user must be able to profile and resharpen the tool system.
- The increase in MDF lining profiles requires wear-resistant tungsten carbide.
- For high production volumes, the tool system needs to be either jointable or, in the case of new machine generations, be HSC-suitable, i. e. suited to high rotation speeds up to n = 12000 min^{-1}.
- Furthermore, the number of staff required for tool preparation must not be too high, as the staff is needed to produce the mouldings.

Leitz has developed a user-friendly and highly efficient knife system called PowerKnife System, or simply PKS®, specifically for the high requirements of profile moulding production.

PKS® is a development of the Leitz MicroSystem, which has provided valuable service over the years. It is compatible with all serrated back profile cutterheads with 60° serration, either with bore or HSK. The system consists of a tungsten carbide blank knife and a hardened steel backing plate. Both parts are form-fitting via a serration, but can be separated from each other. The backing plate is secured in the serration of the cutterhead by its serrated back.

This system offers major advantages compared to tipped knives with brazed-on tungsten carbide, and other two-part knife designs:

- For the maximum concentric running, the knives are profiled or resharpened when installed in the cutterhead, machining the tungsten carbide edges and the steel backing plate separately with the appropriate grinding wheel. The backing plate is profiled only once, while the tungsten carbide edge is resharpened several times and can be replaced separately. Thanks to the single-material machining of tungsten carbide or steel, grinding wheel consumption, processing time and tool cost are reduced.
- The resharpening depth of the tungsten carbide knife is 10.8 mm, approx. 40 single average performance times.
- The adjustment area of the knife system is defined by the design. It is not possible to project the knife too far out of the tool. This ensures safe operation of the system at all settings.
- The form-fitting connection between the tungsten carbide knife and the backing plate by just one serration ensures the parts are in contact over the whole surface, enabling maximum positioning accuracy, as one serration by definition does not lead to pitch errors.
- The comparatively large increments of 1.8 mm when adjusting the tungsten carbide knife enable six to eight resharpening processes in one installed position. In relation to the overall single performance time of one knife, this reduces knife mounting and setting time.
- The two-part design allows use of more wear-resistant tungsten carbide grades compared to brazed tungsten carbide knives and significantly increased performance times.
- Only ultra-fine tungsten carbide grain grades are used. And the cutting face has a mirror finish. Combined, these give extremely sharp cutting edges and a perfect surface finish.

The PowerKnife System PKS® is available as
– non-profiled blank knives with the heights 50, 60 and 70 mm for profiles to a profile depth of 33 mm
– knives with a height of 40 mm for planing or jointing. This knife height matches the tool diameters for jointing in the moulder.

Only ultra-fine grain tungsten carbide qualities are used as:
– HW-30F for solid wood, preferable hardwood
– HW-10F for wood materials such as MDF, WPC.

Tool example for PKS®:
Multi-profiling of MDF mouldings

The knives can be jointed in the moulder. When used with HSK tools, experience has shown that the ground accuracy is sufficient to allow a Z2 tool at 12000 min^{-1}, e. g. in MDF to run at a feed speed of 50 m/min, and give a finish quality even without jointing. Productivity can be increased still further through parallel profiling of several mouldings and subsequent splitting. PKS® with cutting widths of up to 310 mm are available.

Even if profiled by the user, it is sometimes necessary to use the competence, expertise and equipment of a specialist to prepare the tools. Leitz, with its service centres around the world, offers this service. The tools are mounted, ground and measured. The profile specific measuring points are defined as specified by the user and the measured data documented on the accompanying tool card. The tools are returned in a reusable transport container. Your production staff can concentrate more effectively and efficiently on their actual task – producing mouldings. This service package is extended still further by integrating the user's CAD profile data in the service centre grinding programs, as well as providing a telephone hotline for urgent cases.

Tree

Structure of a trunk

Cross section of softwood (spruce)

Cross section of hardwood (beech)

As a renewable material, wood is a raw material which is important because of its strength and low density and because it is found all over the world. As a result, wood is used widely in support structures in timber construction and in non load-bearing areas such as building components, furniture or interior fittings. In its dry state, wood possesses low thermal conductivity properties due to its porous cell structure which means it has a certain level of heat insulation. Wood is therefore a good raw material from an energy point of view and is, for this reason, used in window frame elements or insulation panels. Wood is also used in its natural form (solid wood) or converted into wood materials.

There are several specific properties which must be considered in the selection, application and processing of solid wood. The **most important properties** are: **inhomogeneity, anisotropicity, porosity, hygroscopicity and biodegradability**. The structure of wood consists of fibres stronger in a longitudinal than in a lateral direction. The fibres consist of cell walls which form the actual wood substance and of vessels (also known as „pores“). The relationship between the volume of the pores and the mass of the wood substance determines the bulk density and varies from one wood type to the next. Depending on the time of year, the pores become larger (spring, summer → **earlywood,** lower density) or smaller (autumn, winter → **latewood**, higher density). This phenomenon can be seen by taking a cross section of the wood and observing the growth rings from successive earlywood and latewood periods. With slow growing wood in cold regions, these growth rings are tight together, whereas with quick growing wood from warmer regions, the growth rings are spread out. In contrast, these differences are barely noticeable in tropical woods.

Wood develops by a process of cell growth and cell multiplication within the growth ring, or cambium. Most cells develop inwards to form the wood structure, while some grow outward, forming the bark and phloem, or inner bark. Every tree is built in layers; a cross-section through the trunk is as follows from outside to inside: bark, phloem, cambium, sapwood (medullary rays, annual rings, spring growth and summer growth, resin ducts), heartwood (without sap capillaries: this is purely structural in function) and pith.

There are two main wood types: **hardwoods and coniferous woods**. Coniferous woods are older in evolutionary terms and therefore have less complex cell structures involving two cell types. The tracheids (elongated, tapered) are strong and act as conductors. Water is exchanged between the cells through so called pits or bordered pits. The parenchyma cells (rectangular) are responsible for transporting the nutrients and storaging starch and fats.

In contrast, functions are divided between the cells in hardwoods. The cells are divided into vascular tissue, ground tissue and seed tissue. The main feature which differentiates hardwoods from coniferous woods is the vessel elements (tracheids) in the vascular tissue. These can be seen as pores in a cross sectional view, and as striations in a longitudinal view. The arrangement of these wood vessels determines whether the wood is ring porous (e.g. oak, ash), semi ring porous (e.g. cherry, walnut) or diffuse porous (e.g. birch, beech, poplar).

While there is a general similarity between softwood and conifer, hardwood and broadleaf, there are exceptions such as yew – which is a hardwood – and alder, birch, lime, poplar and willow – which are softwoods.
For processing and tool selection, factors such as density, strength, elasticity and hardness are important considerations. Accordingly, the categorisation of **hardwood and softwood** is important insofar as it provides a broad guide to these properties.

Sapwood (bright) and heartwood (dark) (example pine)

Merely the „appearance“ of the timber, lumber or planed timber can give information on the properties and on the potential level of difficulty during the woodworking process. **Sapwood and heartwood** from a tree have different properties, for example. The sap flows in the outer layers of the trunk. This leads to an outer area of sapwood with a higher level of moisture and inner areas of less moist heartwood. Sapwood and heartwood are always of varying quality. With increasing trunk diameter, the relative size of the heartwood becomes greater as the sapwood or ripewood progressively converts to heartwood. Once converted to heartwood, the material ceases further structural change. Both sapwood and heartwood are present in all types of tree, although they are more easily distinguished in the so called „heartwood trees” – such as oak, larch, pine, cherry and ash – than in „sapwood trees” – such as beech, fir and spruce; these may very little in colour.

Earlywood (bright) and latewood (dark) (example Pinus Radiata)

During wood processing and woodworking procedures it must be remembered that wood is a material with varying structures and properties. The growth rings are particularly indicative of this fact in coniferous woods. The are significant differences in hardness between the marked areas of **earlywood and latewood**. During woodworking process, these circumstances must be taken into consideration and cutting materials, cutting material geometries and process parameters must be adapted correspondingly. When processing various types of wood often a compromise for various types of wood is required.
Bulk density is the decisive factor for most technical properties. Bulk density is the ratio of the mass and volume (including all vessels). Depending on the type of wood, bulk density is usually between 100 kg/m^3 and 1200 kg/m^3. Higher bulk density means that the wood is harder, firmer, tougher to process and treat and also harder to dry. Tool wear also increases in direct proportion to the bulk density of the wood. Other factors which influence cutting edge wear are wood components such as tannic acid or silicate inclusions. Natural tannic acids, such as those present in oak, lead to the chemical wear of tool cutting edges, particularly if the wood has a higher moisture content. Silicate inclusions, such as those present in tropical woods of Meranti, Teak or Mahogany, are absorbed from the ground along with nutrients and then crystallise in the vessels. They cause increased abrasive wear to the cutting edges. Large density differences between earlywood and latewood normally are a sign of strong presplitting and a tendency to splinter during processing (example: Pinus Radiata). The increasing global wood demand is the reason why trees are more and more bred in forest plantations. Those so called plantation woods are generally fast-growing species such as Radiata Pine, Eucalypts, and Poplars. These plants show rougher annual growth rings, lower density and strength in comparison with the plants grown in natural forests. Due to the stronger predisposition of trunk splitting and defibering sometimes the cutting of plantation woods presents a real challenge. It requires both special machining technology and special tool solutions. Long-fiber woods as Poplar are used as raw material for wood-based materials.

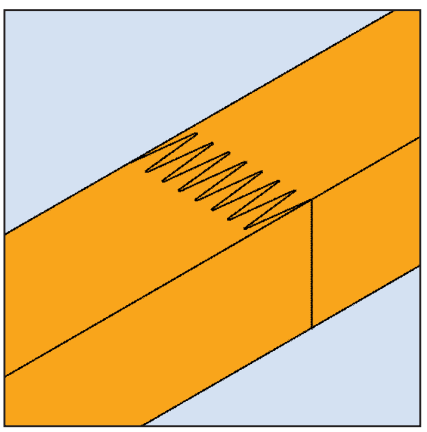

Type of wood	Bulk density [kg/m³]	Strength [N/mm²]		
		Compressive	Bending	Shearing
Hardwoods				
Afzelia	750 - 950	65 - 79	90 - 120	7.5 - 15.0

Fir	350 - 750	31 - 59	47 - 118	3.7 - 6.3

Table: Bulk densities and strength values (moisture content: 12%) for established wood types (source: Holzatlas, Wagenführ, 2007)

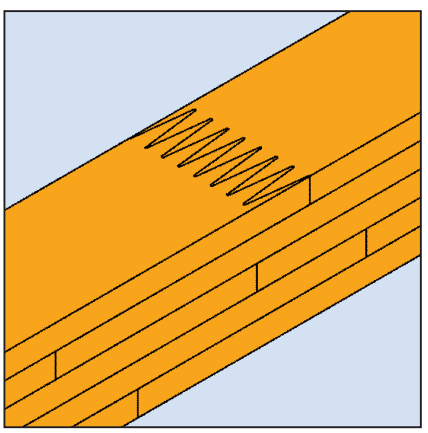

The Brunell **hardness** of woods is tested at 12% moisture content. The hardness parallel to the fibres will be approximately double that perpendicular to the fibres. Because of the differing cell forms and varying structures within the wood, hardness figures can only be quoted as guidelines. They are, as for density values, highly dependent upon the moisture content of the wood.

Other physical properties which are of importance when working with wood are its **elasticity and strength**. Elasticity is a measure of the ability of a solid material to return to its original configuration from a distorted state (unit: E-modulus, N/mm²). When judging the strength of timber, it should be remembered that knots, splits, spiral grain and other structural idiosyncrasies have a significant effect on this property.

Moisture content plays an essential role in terms of how the wood is processed and the quality of the end product. Moisture content is the percentage of water in relation to the dry mass of the wood. In freshly harvested wood, water is both bound in the cell walls as well as contained in the vessels. Moisture content can be over 100% in this case. If the water has escaped from the cell vessels and is only present in the cell walls, then the term „fibre saturation point“ is used. This varies from wood type to wood type and is usually at around 30% moisture content. Below this saturation point, the wood shrinks and swells when moisture is released or added. With kiln dried wood, moisture content is 0. In order to achieve sufficient dimensional stability, the wood should therefore be dried before the finishing process so that the moisture content corresponds with the moisture content of the environment in which it will be used. This is known as the equilibrium moisture content. Indoors, this value is somewhere in the range of 6% to 12%, and is somewhere between 8% and 16% outdoors (without direct exposure to the elements). Moisture content needs to be between 12% and 14% for the best possible woodworking conditions. Below this value, the wood has a greater tendency to split, and above this the surface roughness is increased through shrinkage during final drying.

Structural solid wood (KVH)

Laminated timber (BSH)

Due to its limited dimensions, its swelling/shrinkage and its inhomogeneity from knots and branches, solid wood is usually further refined into **semi finished products**. With structural woods, weak points such as branches or cracks are cut out. Through finger jointing on the end grain edges, components can be manufactured to be any required length. By laminating planks or boards parallel to the wood fibres, larger component cross sections can be created and strength increased. Products in this area include solid structural timber and glue laminated timber. For window frames, for example, the laminated strips can be manufactured using a wide range of wood types with a variety of properties.

Modified woods

A large number of modification techniques have been developed and tested over the past few years in an attempt to identify suitable methods for making woods which are available in sufficient quantities dimensionally stable and weatherproof for use outdoors. Pinus Radiata, for example, is stabilised through an acetylation process (Accoya®). Pine is treated with a pressure impregnation process (Belmadur®). Dimensional stability and weatherproofing of thermotreated wood is generated through a pyrolysis process.

Modified wood (examples)
Accoya®, thermal beech, Belmadur®

One common factor in all of these techniques is that they do not just have an effect on areas near the surface of the wood, but on the material as a whole. These techniques have created „new types of wood“ with minimal swell/shrink behaviour, increased hardness and modified woodworking properties. Cutting forces and wear are lower than with natural woods. Brittleness and dust formation during processing are higher, but these factors do not cause any fundamental limitations.

All materials which are manufactured from wooden structural elements, such as panels, veneer, chips or fibers, are known as wood derived materials in both lay and specialist terminology. Wood derived materials started being developed in the 1920s. Then, large, flat pieces of wood with different thicknesses were bonded and pressed together with the fibres running in different directions. Plywood panels and multiple layer panels opened the way for new designs and construction opportunities.

Cross laminated timber CLT

After 1950, an independent woodchip material industry developed on a global scale from the beginnings of chipboard manufacture in the 1930s. This industry concentrated on panels or moulded parts made from the chips or fibres of hardwoods and coniferous woods, and also of lignified annual plants (such as straw or flax). In the DIN 4076 standard, wood based panels are classified by type, structure and bulk density. The manufacture of wood based panels allowed the development of furniture manufacture on an industrial scale.

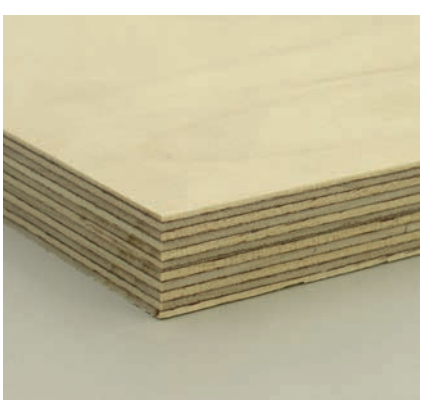

Today, wood materials are roughly divided into:

- **Solid wood and veneer materials:**
  such as laminated timber, plywood, veneer plywood or multiplex boards
- **Woodchip materials:**
  such as flat-pressed panels (chipboard), particle boards, oriented strand boards (OSB)
- **Wood fibre materials:**
  Medium-density fibreboard (MDF), high-density fibreboard (HDF), hard fibreboard or wood fibre insulation boards
- **Wood composites:**
  such as wood plastic composites (WPCs); light weight building slabs – high-strength surface layers with a soft core of foam, balsa wood or honeycombs of cardboard or plastic; synthetic resin compressed wood (armourply) – compressed materials made from beechwood veneer and synthetic resin (bulk density: 900 – 1400 kg/m^3)

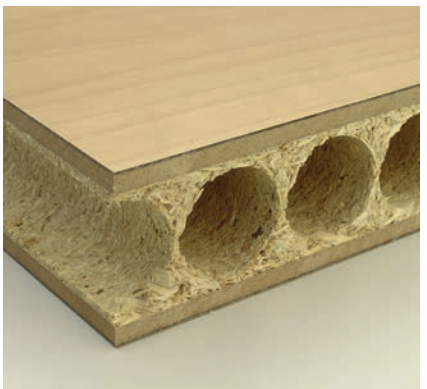

Block board

The objective with all these wood materials is to generate a material which is isotropic in at least two dimensions, despite the anisotropic properties of wood. A layer structure which is symmetrical with the midplane of the board is an important pre-requirement to guarantee warp free boards.

Multiplex plywood

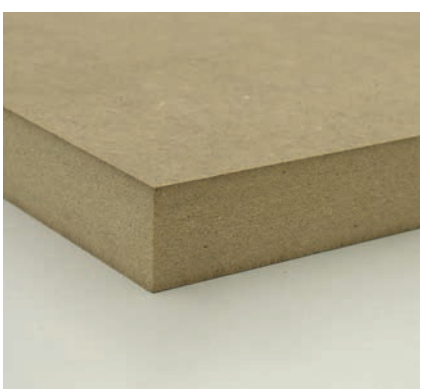

With **solid wood and veneer materials**, quasi-isotropic properties are obtained through the individual layers being bonded together parallel to their fibres. During the woodworking process with such materials, the tools must be configured for simultaneous processing both parallel and perpendicular to the fibre direction. The glued joints usually generate the highest tool cutting edge wear.

Extruded chipboard as heart of a composite material

Chipboard, plastic coated

MDF board

Chipboards are divided into two different categories, flat pressed panels or particle boards, depending on the pressing method used. With flat pressed panels, the woodchips are primarily oriented in the direction of the panel. A variety of layers with a variety of properties can be manufactured by changing the size of the woodchips. Usually, panels are manufactured as three layer panels. The middle layer has large woodchips whereas the two outer layers have finer woodchips giving a smooth surface. In contrast, woodchips in particle boards lie predominantly perpendicular to the direction of the panel. They have the same structure through the entire cross section.

Chipboards are classified by strength and moisture resistance to DIN EN 312-1.

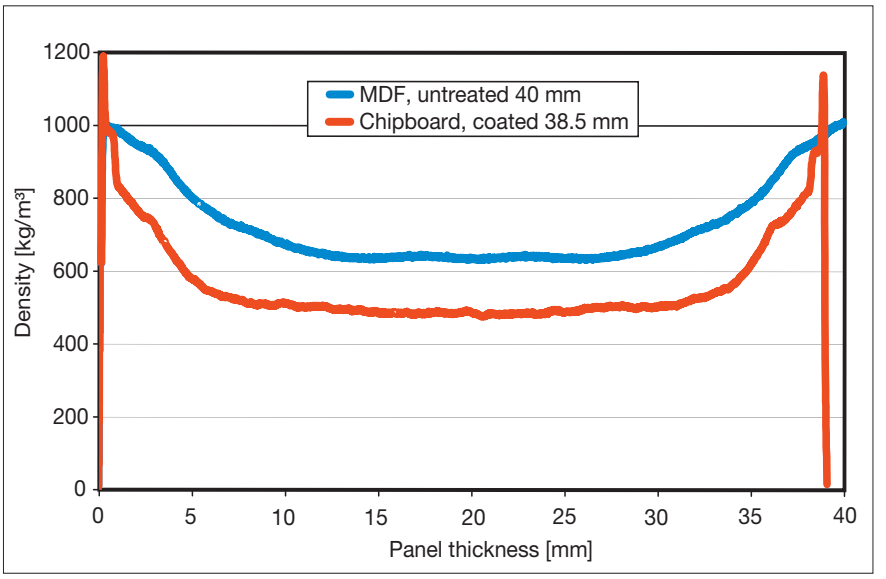

General use (non load-bearing function)	General use, also for load-bearing components	Heavy duty for load-bearing components
P1 for light panelling in dry areas	P4 dry areas	P6 dry areas
P2 for furniture and interior fittings in dry areas		
P3 in moist areas	P5 moist areas	P7 moist areas

Fungicides and flame retardants can also be added to the boards during the manufacturing process.

The most important features of chipboards are, however, their bulk density and their strength. Heavy chipboards (such as flat pressed panels), widely used in furniture and interior fittings, have a bulk density of between 450 and 750 kg/m^3. During storage of the wood, non wood materials such as sand and small stones enter the manufacturing process, meaning that chipboards have a certain level of sand content. Sand content and particle size play a vital role in tool wear, which is why diamond tools are predominantly used in industrial processing. The shortage of raw materials has resulted in waste wood increasingly being processed into chipboard which means that the proportion of impurities in the wood is increasing.

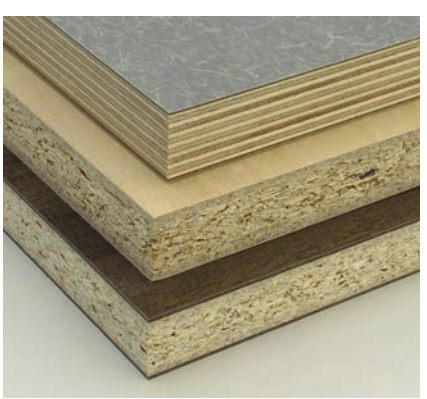

The large number of particle boards' variations depending on their composition and the related properties as lacking distortion and decorative coatings explains the frequent and versatile use in furniture manufacturing and interior fittings.

Alongside woodchip materials, **wood fibre materials** are also classified according to their composition and method of manufacture. Porous fibreboards with a bulk density above 230 kg/m^3 as well as medium hard, hard and extra hard fibreboards with a bulk density up to 800 kg/m^3 are manufactured from wood or other lignocellulose fibrous raw materials.

Density profiles of chipboard and MDF

„Medium-density fibreboard“ (MDF) became more and more important in furniture and interior fittings constructions in the 1980s as a further development of woodchip and wood fibre materials. Just like solid wood, the surfaces and edges of MDF panels can be profiled and finished as a result of their homogenous structure. They are predominantly manufactured from bark free coniferous wood which undergoes several phases of preparation to turn it into dry ultra fine fibres. This substance is then pressed together with glues which are low in harmful substances to create a panel with a roughly constant density. Bulk density is usually somewhere between 600 kg/m^3 and 1000 kg/m^3. According DIN EN 316 there are three different types: HDF (≥ 800 kg/m^3), light MDF (≤ 650 kg/m^3) and ultra-light MDF (≤ 550 kg/m^3).

Coated panel material

When processing with machine tools, the **type of coating** must also be kept in mind alongside the physical and chemical properties of the materials. All types of wood materials are usually delivered as a finished product with some kind of coating. Surface finishes range from veneer and paint to paper and plastic of various thickness and hardness. Typical examples of the latter category are melamine resin or HPL (high-pressure laminate) coatings. The hardness and structure of the coatings mean that cutting geometries need to be adapted to ensure tear free processing. Overlays of laminate panels, which contain corundum particles to increase abrasion resistance, generate the highest levels of cutting edge wear.

Wood materials, with their wide range of specifications, have, like no other material, changed the way products are designed and the way materials are processed. Every new type of material brings with it new demands in terms of machinery and tools. Tear free cutting edges and precise profiling must be achieved with efficient manufacturing methods. Every further development with wood materials therefore leads to new and specially adapted tool designs and, if necessary, new processing methods.

Thermoplastic plastics
(solid material)

Extruded plastic profiles

Polymer clumping in the case of
thermoplastics (schematic diagram)

Gloss cut section on PMMA workpiece

Plastics consist of interwoven molecule chains, polymers, which in turn are composed of repeating structural units called monomers. The type of polymer bond determines the plastics properties. There are three main groups: thermoplastics, thermosets and elastomers.

Two common factors for all plastics are a low density and low thermal conductivity. The different properties of different types of plastics must be taken into account in machining work. High quality, efficiency and production security can only be achieved with tools and machining parameters specially customised to the material.

Thermoplastics

In thermoplastics, the molecule chains are crosslinked. A typical characteristic of thermoplastics is that they have a temperature at which they soften. Once a thermoplastic is heated above this temperature, it is soft and can be formed and shaped. Below this temperature (specific to a particular thermoplastic) thermoplastics retain their original shape. Thermoplastics can be used in a number of processes – injection moulding, extrusion and press forming.

Thermoplastic plastics also can be strengthened by fibres in order to increase density. Normally this involves short fibres so that the extrudability is continued. This technology for example is used for window profiles so that a reinforcement with steel inserts can be renounced.

The temperature at which thermoplastic starts to soften is around 60°C (depending on the specific plastic), a temperature relevant to the machining process. Exceeding the softening temperature during machining is detrimental to the machined quality. The chips melt, the tools become sticky, and both quality and production are no longer consistent. As well as specific tooth geometries and tool chip gullets, selecting the machining parameters is of upmost importance. Permitted cutting speeds are usually lower than those permitted with woodworking.

Transparent thermoplastics such as PC and PMMA require special processes. A transparent cutting surface is often required. This means having a totally smooth cutting edge with no visible cutter marks, a special cutting geometry and, of course, stable machinery with good clamping. A high quality cut can be achieved with polished tungsten carbide cutting tools. Monocrystalline diamond is the preferred choice for completely glossy surfaces. If these measures are not taken, the result is a matt cutting surface.

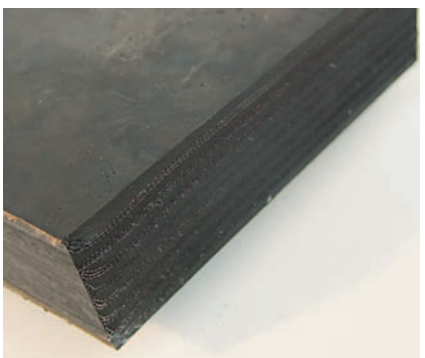

Structure of thermosets
(schematic diagram)

Compact laminate panel

Structure of elastomers
(schematic diagram)

Elastomer with fabric insert

Thermosets
In thermosets, the molecule chains are irreversibly cured at cross linking sites, or nodes, through chemical bonds.
When a thermoset is heated up, the monomers begin to move. The intensity of these oscillations increases as the temperature rises. When the temperature rises above a critical point, the nodes are irreversibly broken. As a consequence, thermosets are destroyed at a temperature specific to the material – the pyrolysis temperature – which is above 150°C. Thermoset materials are usually moulded or, in the case of composites, pressed. They are usually hard and brittle.

To improve the properties of thermosets, **reinforcement materials** in the form of laminated paper, fibreglass, carbon fibre or aramid fibre are incorporated into the thermoset mass. The different combinations of these materials have been given new grade designations such as FR-2, FR-3, FR-4, CEM-1, CEM-3 etc. (for example, FR-4 is glass reinforced epoxy laminate).

Typical examples for duroplastic working materials are for example compact laminate panels or high pressure laminates (HPL laminates) of melamine - or phenolic papers, printed circuit boards (PCB) or PU-foam.

The focus is not on the temperature during the machining process. The cutting speeds are higher than those for thermoplastics. Due to the hard brittle material properties and the abrasive effect of the embedded fibres, tools used in conjunction with thermosets require different geometries and cutting materials than those used to process thermoplastics.

Elastomers
Elastomers are soft plastics, more commonly known as „rubber“, which can be shaped and then go back their original form when released. This particular property is due to the wide meshed structure of the molecule chains. They do not soften when heated. Machining is possible, but rare. The main difficulty is clamping the workpieces.

Mineral constituents are attached to board materials using a bonding agent. The materials have specific properties depending on the proportion and type of bonding agent and mineral constituents. Compared to wood materials, the cutting speed for mineral materials must be decreased.

Mineral working material

Polymer bonded mineral materials
(e.g. Corian, Hi-Macs, Kerrock, Noblan, Surell, Varicor, Velstone)
Two thirds of these materials consist of natural minerals (e.g. aluminium hydroxide, feldspar) which are bonded in an acrylic polymer (PC) matrix. The material can be shaped at high temperature due to its high proportion of acrylic. The proportion of mineral materials raises the softening temperature of the plastic, which makes machining easier. These materials are mainly machined using tungsten carbide or polycrystalline diamond cutting tools. Very large mineral particles can damage diamond cutting edges so, as a result, tungsten carbide cutting edges are recommended in this case.

Polymer bonded mineral materials are available as panels with a thickness between 4 mm and 20 mm, and as moulded parts (e.g. wash basins). They are usually applied to wood based panels and can be joined by adhesion and flush trimming. Large scale components can be manufactured using this process. To obtain straight and scratch-free saw cuts, AS foil vibration damped sawblades are recommended.

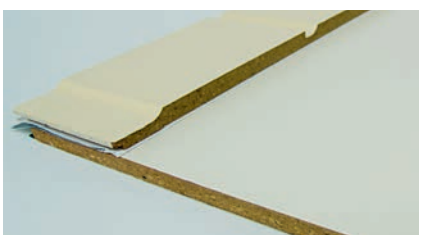

Perlite panel

Perlite-based fire protection board
A characteristic of this material is that it has a highly abrasive action on the tool body. Circular sawblades' bodies are particularly vulnerable to this problem. The gullet is eroded and as a result, the tooth breaks away although the carbide tip has not reached the wear limit. That is the reason why the use of special tool design with wear-protected basic-bodies and jaws are recommended.

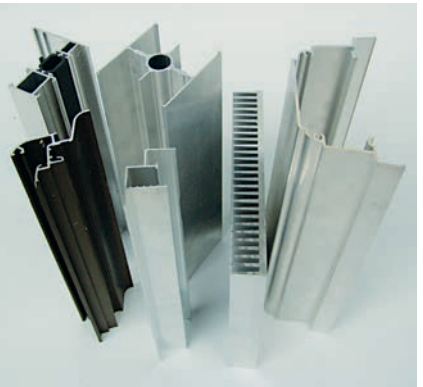

Plaster board / gypsum board

Regular and fibre reinforced plaster board
These materials are machined in dry and „wet" condition. In the wet condition, tungsten carbide is recommended as a cutting material. Diamond is suitable as a cutting material for dry but not wet machining.

Cement fibre board

Fibre reinforced cement slabs
One of the special properties of fibre reinforced cement panels is their high density. If unsuitable machine parameters are chosen, sparks may occur during machining. Tungsten carbide has only a short run time; thence diamond is preferred as cutting material even by power-driven hand tools or high-volume work.

Aluminium extruded sections

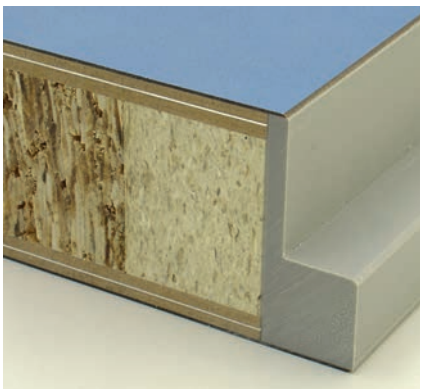

Wrought aluminum alloys are the most common examples of **non-ferrous metals**. They exist as hollow or full profiles, as sheets or as surface layers or intermediate layers in wood materials.

Silicon is added to increase machinability. Si content ≥ 12% leads to increased cutting edge wear which is why diamond cutting edges are recommended. If the Si content ≥ 12%, the aluminum tends to „fuse“ to the cutting edge during machining and this quickly leads to build up on the edges. Tungsten carbide should be used, if possible, together with coolants (minimum quantity lubrication – MQL).
Tools with diamond cutting edges (PCD) are particularly suitable for dry machining. Build up on edges are avoided and better machining quality is achieved due to the extremely high thermal conductivity and low friction values of diamond. Sawblades with specially shaped teeth and small cutting angles (some negative) are employed in cutting hollow profiles to avoid the teeth hooking the thin web. Foil saws are particularly suited for scratch-free trim and mitre cuts due to their good vibration damping properties.

A **composite** consists of two or more materials which are combined to produce different material properties. Composites have different properties to the materials with which they are combined.

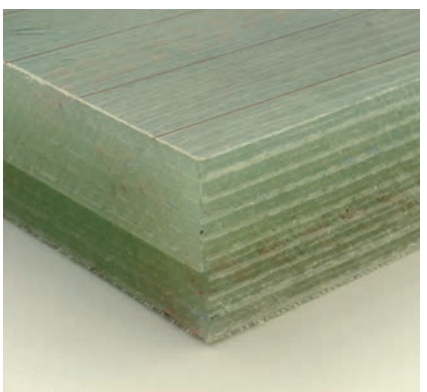

Essentially, there are two groups:

Composite layered materials, such as:
- Composite panels (e.g. plywood or wood core boards)
- Sandwich panels (stable outer layers with a soft core)
- Honeycomb panels
- Chipboards with aluminium barrier layers (vapour barrier)
- Window frames with insulation material as a middle layer
- Floor panels with a HDF core and a variety of surfaces (PVC, cork, felt®)

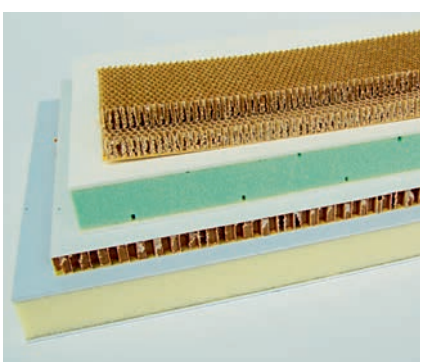

Layer composite working material

Composite fibre materials, such as:
- Carbon fibre reinforced plastic (CFRP)
- Glass reinforced plastic (GRP)
- Aramid fibre reinforced plastic
- Natural fibre reinforced plastic
- Wood plastic composites (WPC)
- Fibre cement boards

Fibre composite working material

The difficulty in terms of machining is a result of the often conflicting requirements of the individual material components concerning the cutting edges, meaning the tools usually have to be specially designed for particular composites. In the case of composite layered materials, a variety of cutting materials can be employed at the same time to machine the different layers (so called hybrid tools). Because of the different strengths of the individual components, there is often the risk of delamination from the cutting forces.

Lightweight working material with honeycomb or foam core

Profit is made at the cutting edge! Wear resistant cutting materials with sharp cutting edges guarantee long tool life and high surface quality. The full potential of a cutting material needs the correct cutting edge geometry, and in turn, is dependent on the machining process and the properties of the material being shaped.

K-grade: WC + binders
P- and M-grade: Additionally with WC-TiC and WC-TaC mixed crystals for higher temperature strength

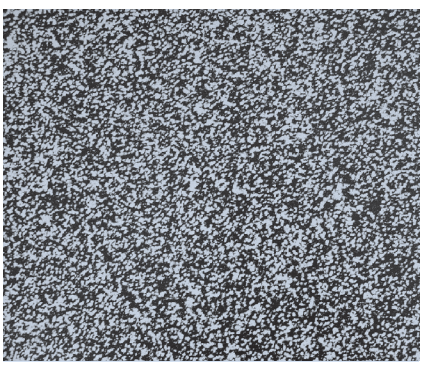

Cutting materials for processing wood and plastics
The ideal cutting material should be hard and tough at the same time, but an „all-purpose material" of this kind simply does not exist. Today the choice of woodworking cutting materials range from tough tool steel to the hardest material in the world, diamond. The wide variety of workpiece materials and tool designs need all of these cutting materials:

Group	Application / working material	Code	Hardness	Viscosity
P	Steel, steel casting, long-chipping, malleable iron	P01	↑	↓
		P10		
		P20		
		P30		
		P40		
M	Steel, steel casting, austenitic manganese steel, austenitic steel, free cutting steel, alloyed grey iron	M10	↑	↓
		M20		
		M30		
		M40		
K	grey iron, chilled iron, short-chipping malleable iron, hardened steel, **non-ferrous metals, plastics, wood, wood-derived materials**	K01	↑	↓
		K05		
		K10		
		K20		
		K30		
		K40		

Cutting material with abbreviation	Composition, manufacture	Characteristics and possible use
SP Alloy tool steel	alloy content < 5% (C > 0.6%). Few carbides, therefore only low hardness and heat resistance. Manufactured in a molten-metallurgical process.	Hardenable up to 60 HRC. For solid wood processing in the craft sector, e.g. as a profile knife for universal cutterheads.
HL High-alloy tool steel	alloy content > 5% Alloy elements Cr, Mo, W and carbon form carbides which allow for hardness and wear resistance. At least 1 alloy element > 5% e.g. B 12% Cr and 2% C. Manufactured in a molten-metallurgical process.	Hardenable up to 63 HRC. Very corrosion resistant from high Cr content. Preferably used in planing mills for soft woods, e.g. solid cutter for manufacturing tongue and groove boards at high feed speed.
HS High performance high speed steel (HSS)	alloy content > 12% Alloy elements W, Mo, V, Co and carbon form carbides which allow for hardness and wear resistance. Manufactured in a molten-metallurgical process, followed by machining processes - linear distribution of the carbides manufactured in a powder-metallurgical process (PM-HS) - higher alloy contents possible, homogen distribution of carbides.	Hardenable up to 65 HRC. Preferably used for solid wood processing, mainly soft woods, e.g. planers, jointing cutters, profile blanks or tipped profile cutters. Considerably longer tool life compared to HL steel. The best relation between toughness and hardness is achieved with HS steel manufactured in a power-metallurgical process (PM HS).
ST Cobalt-based cast alloys	Almost completely non-ferrous alloys of: Co, W, Cr. Manufactured in a melting process.	Hardness 40 to 58 HRC. Particularly corrosion and temperature resistant, tough (small cutting angles possible). Typical applications: Processing of fibrous or damp, acidic woods in sawmills or planing mills, and machining oak, Meranti or poplar.

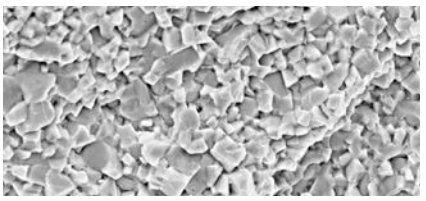

Roco-shaped structure for melting made HS steel

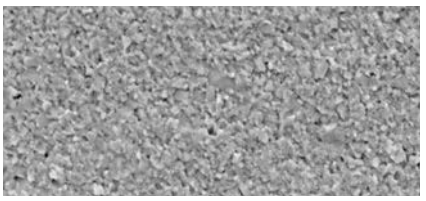

Homogenous structure for PM-HS Steel

11.2 Cutting materials

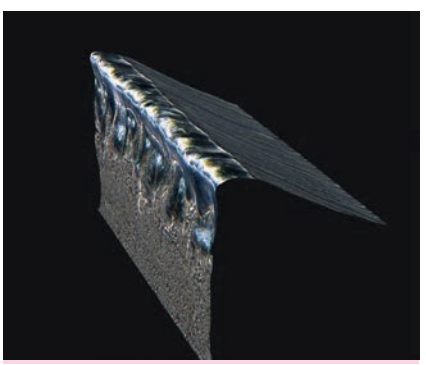

Fracture of a standard tungsten carbide.

Fracture of an UF-tungsten carbide.

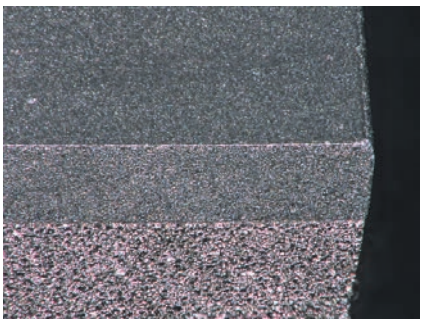

Sharp-edged wear on a coated HS edge.

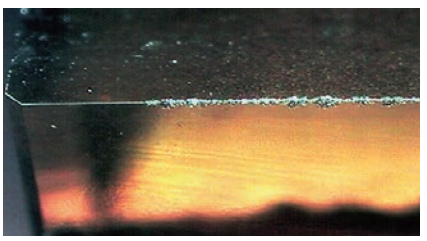

Rounding- and erosion wear on an uncoated HS edge.

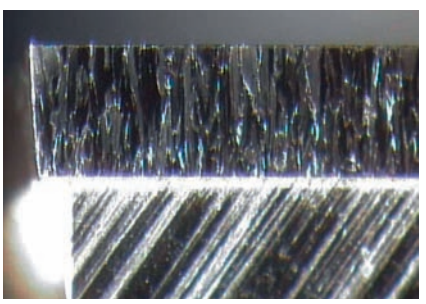

Cutting material with abbreviation	Composition, manufacture	Characteristics and possible use
HW Carbide metals	Sintered materials composed of metal carbides and metallic binders (mainly WC + Co). Manufactured in a powder-metallurgical process by mixing and pressing the basic powder materials, followed by sintering at high pressures and temperatures.	Hardness between HV 1300 and 2500. Hardness and toughness can be varied over a wide range by altering the grain size and quantity of the binder in the mix. Universal cutting material for wood processing with wide range of application from knotty softwood with glued joints to panel materials and solid plastics. Ultra fine carbide metals allow for very sharp cutting edges as a prerequisite for paintable surfaces.
SC (MC) Steel, coated **HC** Tungsten carbides, coated	2 – 3 µm thick hard material coating on the blade. Coating materials: Nitrides, carbides, carbon nitrides or oxygen nitrides from the elements Ti, Al, Cr, Zr. Manufactured in a vacuum coating process. A new cutting material is created by the coating. The substrate is no longer solely responsible for the wear resistance but assumes a supporting function for the coating.	Surface hardness between HV 1600 and 3500. The chemical and abrasive wear resistance of the substrate at the surface of the blade is significantly increased. The edges remain sharp longer and friction is reduced. Performance times can be improved five fold compared with uncoated tools. This performance is retained even after sharpening. Preferred applications: solid wood, thermoplastics, non-ferrous metals

DP edge polycrystalline diamond layer (on top) sintered on to a tungsten carbide substrate (on bottom)

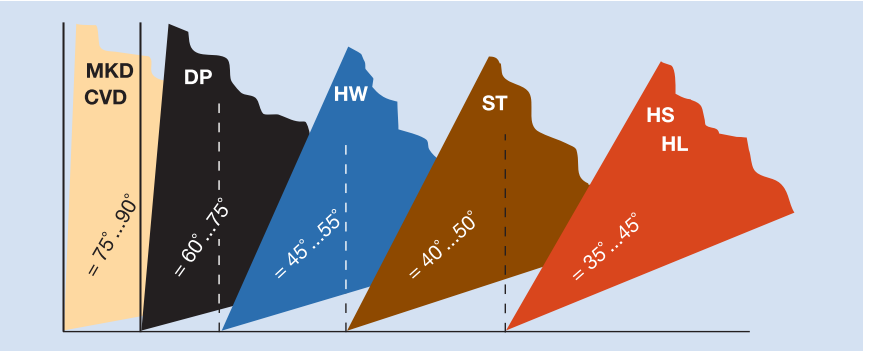

DM edge - monocrystalline synthetic diamond

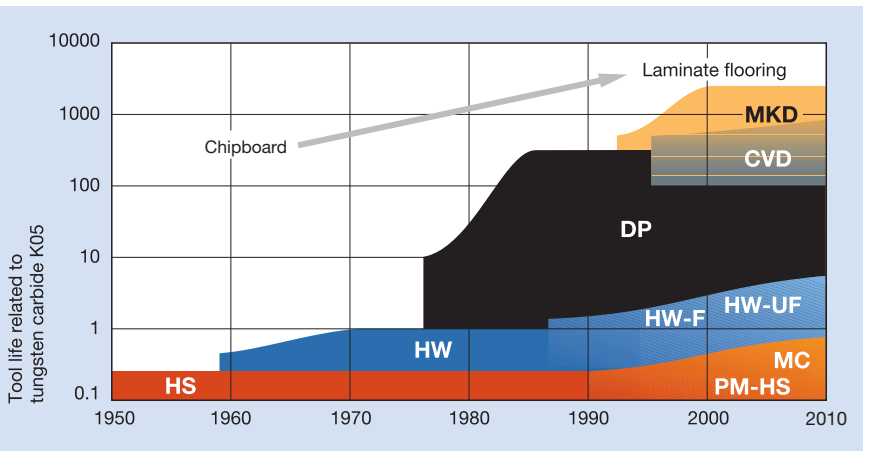

CVD diamond layer of columnar diamond crystalls, soldered on tungsten carbide

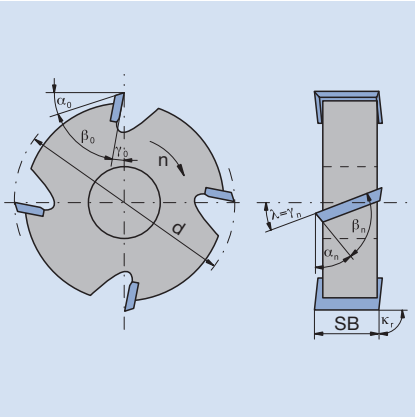

Cutting material with abbreviation	Composition, manufacture	Characteristics and possible use
DP Polycrystalline diamond (PCD)	Sintered layer (0.3 – 0.6 mm) composed of diamond crystals on tungsten metal surface. Diamond grain size: 1 – 30 µm. Manufactured in high-pressure synthesis process. Diamond grains sinter among each other forming a layer and are combined with a tungsten carbide substrate. Due to the diffusion of Co from the tungsten carbide between the diamond grains, the diamond becomes conductive and may be processed by spark erosion.	Composed of the hardest material, wear starts at grain boundaries, very good thermal conductivity. Hardness and toughness can be varied within certain ranges by altering the grain size. The field of application of DP cutting materials ranges from solid woods, chipboards and fibre boards to very abrasive materials such as fibre cement boards, laminate floors or fibre reinforced plastics (composites). Excellent suitability for dry processing of non-ferrous metals.
DM Monocrystalline diamond	Diamond monocrystal (structure with grain boundaries). Manufactured in a high pressure synthesis process. Only available in dimensions of a few millimeters. Processing only possible by grinding with diamond.	Harder than DP. Very smooth cutting edges can be produced as there are no grain boundaries. Can be used for very abrasive laminate overlays or for a polished finish on plastics and non-ferrous metals.
CVD Polycrystalline diamond layer	0.5 mm thick diamond layer composed of columnar diamond crystals grown together, brazed on a tungsten metal support. Manufactured in a plasma CVD coating process. Due to doping with boron, conductible and erodable.	Harder than DP and DM as there is no metallic binder phase and the diamond grains with their crystal grid layer levels are positioned randomly. Used for particular laminate's overlays.

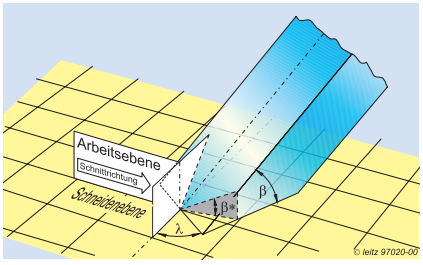

Specific cutting material geometries
Due to the relation between hardness and toughness, there is a specific angle geometry for every cutting material to achieve optimum cutting performance. Hard, brittle cutting materials require a stable wedge angle so the edges cannot break off. Less hard, but tougher cutting materials require larger cutting angles to maintain a cutting edge. Tungsten carbides offer the highest degree of design freedom and can be used for almost every application.

Progress in tool life by different cutting materials
All cutting material developments are aimed at longer tool life. New work piece materials often call for new cutting materials. Chipboard led to the use of tungsten carbide and later to polycrystalline diamond, laminate flooring to monocrystalline and CVD diamond and plywoods to fine grain tungsten. In the 50 years of panel material development, tool life has increased a thousand fold.

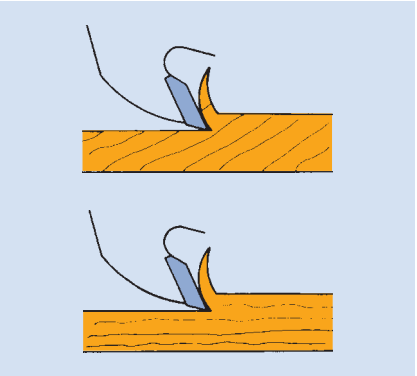

Cutting geometry and description of angles

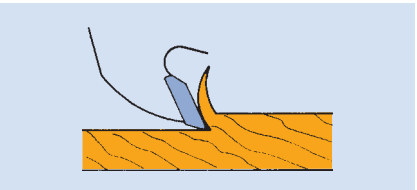

„Shear cut“ - the shear angle effectuates a reduction of the medge angle in cutting direction

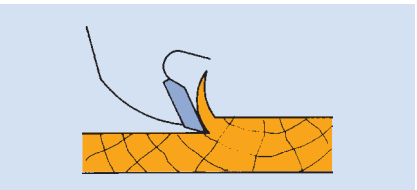

Größe	Symbol	Bedeutung
Cutting angle (Gamma)	γ	Influences cutting force and pre-splitting. For cross grain and tough materials rather large cutting angles, for hard, brittle materials rather small cutting angles.
Wedge angle (Beta)	β	Important for cutting edge stability. Cutting material specific minimum wedge angle required, so that cutting edge does not break off.
Clearance angle (Alpha)	α	Reduces friction between blade and workpiece and resin build up.
Shear angle (Lambda)	λ	Creates a „pulling cut“. Acts as cutting angle for the leading secondary cutting edge (cutting flange). Influences the chip flow in axial direction.
Edge setting angle (Kappa)	κ_r	Enlarges the start of the cutting angle of the blade. For edge setting angles < 10°, almost no cutting actions can be seen (e.g. edging tools).
Secondary cutting edge angle	γ_N	Corresponds to the shear angle of the main cutting edge.
Leading edge angle	β_N	Important for the stability of the secondary cutting edge. Normally larger than the secondary wedge angle of the main cutting edge.
Secondary cutting edge clearance angle	α_N	Reduces friction between secondary cutting edge and workpiece and resin build up.
Diameter	d	Regarding profile tools, the zero diameter (mostly the smallest diameter) sets the processing position of the tool. The maximum diameter is set by the permissible rotational speed n_{max} and for collision factors.
Cutting width	SB	Determines the maximum processing width of the tool.

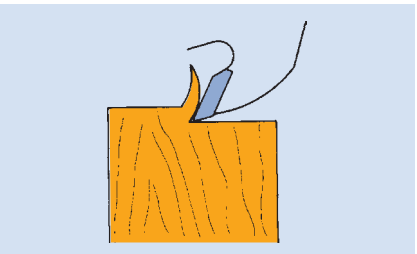

Longitudinal cut with the grain

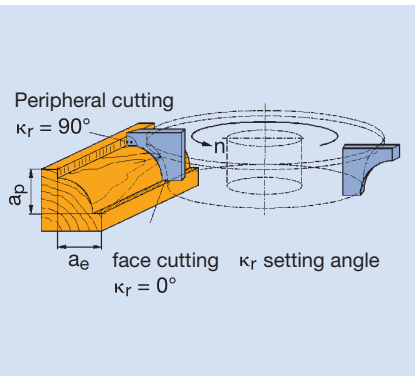

Longitudinal cut against the grain

Cross-cut

Cutting in end grain

Cutting procedure on the example of „profile cutting“

Due to the anisotropy of the wood as a naturally grown material, it can basically be divided into **three cutting directions:**

a) Cutting along the grain
1) With the fibres
Easy to cut. Excellent surface quality and high feed rates possible.

2) Against the fibres
Difficult to cut, as the fibres tend to lift. If possible this cutting direction should be avoided by using alternatives, for example changing the direction of rotation (against feed/with feed).

b) Cutting across the grain
Low cutting forces, but the surface finish is slightly rough surface as wood fibres are „peeled off”.

c) Cutting the end grain
The fibres are cut vertically to the fibre direction. The result are high cutting forces and slightly rough surface finishes. When the cut is completed, fibres may be torn out which is why it is cut with smaller tooth advances and using against a wood backing piece.

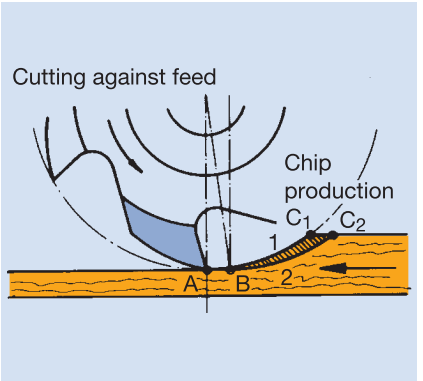

In the case of knotty wood and around branches, all cutting directions may occur at the same time. Due to specific cutting techniques and tool designs for pre- and finish-cutting, a continuosly good processing quality is achieved.

Due to the cutting surface area there are different **cutting applications**:

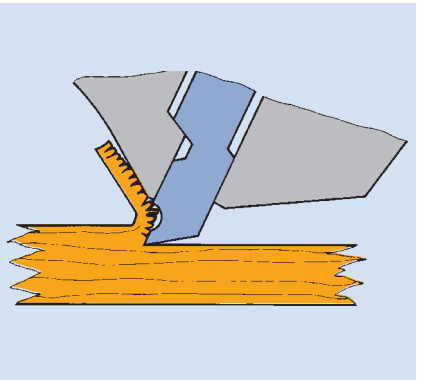

a) Peripheral cutting
The circumference of the cutting tool machines the workpiece. The circumference of the tool is surface determining. The tool’s axis of rotation and the surface of the workpiece are vertical to each other. The enclosed angle, $\kappa_r = 90°$, is called the setting angle.
Examples: planing, jointing.

b) Surface planing
The face of the cutting tool machines the workpiece surface. The front face of the tool is surface determining. The tool’s axis of rotation and the workpiece surface are parallel to each other. The enclosed angle (setting angle) is $\kappa_r = 0°$.
Examples: cutting, circular saws, edging.

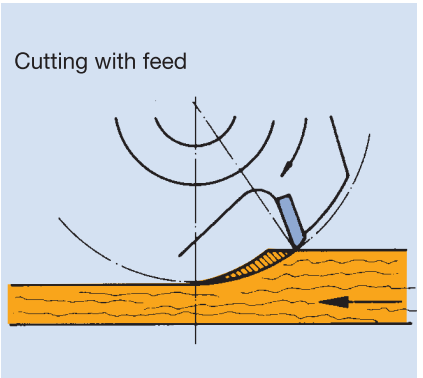

c) Profile cutting
Profiling is a combination of peripheral and face cutting, irrespective of whether the tools have shanks or bores. In general, there is a smooth transition from peripheral to face cutting in profiling. Any setting angle between ($0° \leq \kappa_r \leq 90°$) can occur.
Examples: round profiles, finger profiles or any decorative profiles - but also bevelling, rebating, grooving or slotting.

Chip formation when running against feed

Effect of a chip breaker

Chip formation when running with feed

a) Cutting against the feed
The direction of the tool cut is opposite to the direction of workpiece feed. Initially the cut has zero thickness. Before a chip can form and move across the cutting surface, the cutting edge presses against the workpiece at the start of the cutting angle. The final workpiece surface is created during this initial phase. As the cutting action increases, the cut becomes more stable with the increasing cut thickness. The final stage of the cutting process is when the chip breaks away; this is known as pre-splitting.

AB: friction zone.
B, C1, C2: elongated chip.

Advantages:
Pre-splitting can help reduce cutting forces, the required motor power, and increase tool life. A lower drive output is required.

Disadvantages:
If the direction of the fibres and the pre splitting direction runs from the cutting edge toward the „go" side of the workpiece, pre-splitting creates a rough surface with torn fibres.

A chip breaker ahead of the cutting edge helps form the chip earlier and reduce pre-splitting.

Since there are constantly changing fibre and feed directions during stationary machining on CNC machining centres, special cutting techniques are necessary to avoid unfavourable fibre cutting angles.

b) Cutting with the feed
For mechanical feed only.

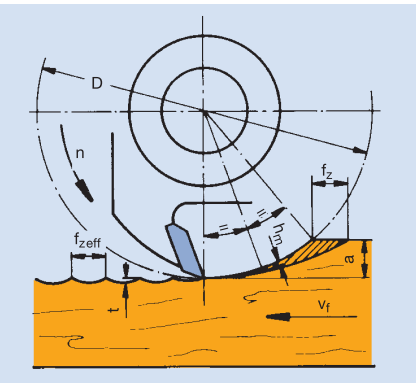

The tool cutting direction is the same as the direction of workpiece feed. Cutting starts at the maximum chip thickness, falling to zero by the time the cut is completed. With increasing cutting action, the chip becomes thinner and finer and with less risk of pre splitting.

Advantages:
Comparatively good surfaces are obtained when there is an unfavourable fibre direction. Lower feed forces required, allowing an increase in the feed speed.

Disadvantages:
The cutters are subject to more severe loads and wear quicker because of the reduced pre splitting. The tool life is approximately 30% shorter compared to cutting against the feed.

There is the danger of tool kick back that means hooking of the cutting edges and acceleration of the workpiece to cutting speed. Cutting against the feed is recommended for manual feed to prevent accidents.

During the peripheral cutting process (e.g. planing, jointing, profiling), the workpieces's surface finish is produced by the peripheral blades. By superimposing tool rotation on the linear feed movement of the workpiece, a succession of cutting actions produce a wave effect on the surface of the workpiece. The pitch, depth and uniformity of these planing or cutter marks determine the machined surface quality. The dimensions of the cutter marks are a combination of the cutting radius, the effective number of teeth, spindle rotating speed and feed rate.

Finish formation and cutting sizes on the example of „chamfering“

These considerations also apply to face cutting tools such as cutters or circular saw blades. The concentric run-out is replaced by the axial run-out.

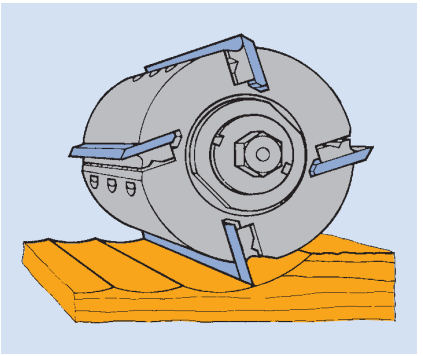

Terms and formulae relations:

v_c	=	$\pi \cdot D \cdot n / (1000 \cdot 60)$	Cutting speed [m s^{-1}]
n	=	$v_c / (\pi \cdot D) \cdot (1000 \cdot 60)$	Speed of rotation [min^{-1}]
v_f	=	$f_z \cdot n \cdot Z / 1000$	Feed rate [m min^{-1}]
f_z	=	$v_f / (n \cdot Z) \cdot 1000$	Tooth advance [mm]
f	=	$f_z \cdot z = v_f / n \cdot 1000$	Feed per rotation [mm] cutter mark length of jointed tools
f_{zeff}	=	$f_z \cdot 1 = v_f / n \cdot 1000$	Effective tooth feed visible on the workpiece [mm] (cutter mark length) [mm]
t	=	$f_z^2 / (4 \cdot D)$	Depth of knife marks [mm]
h_m	=	$f_z \sqrt{(a_e / D)}$	Mean cutting thickness [mm]
a_e	=		Radial cutting action, cutting depth [mm]
a_p	=		Axial cutting action, cutting width

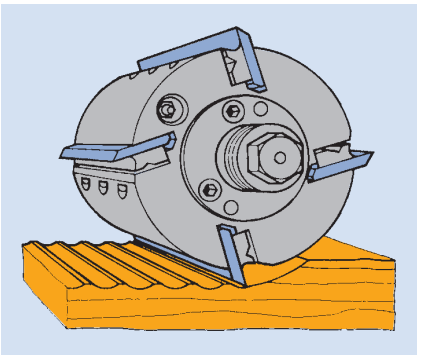

These formulae have numerical values.
All values must be entered using the units of measurement shown in the square brackets [ ].

Top quality surfaces have cutter marks at a regular pitch between 1.3 and 1.7 mm. As the cutter mark length increases, surface finish quality deteriorates but tool life increases. As the cutter mark length decreases, the mean cutting thickness h_m decreases as well. As a result, friction and wear increase and tool life decreases.

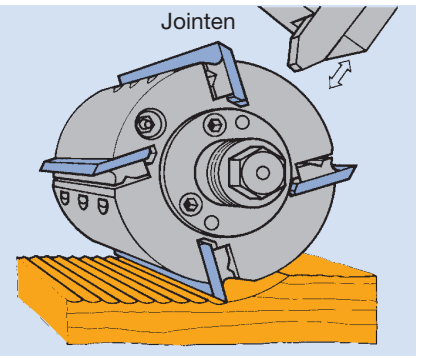

Single knife finish
Due to the production tolerances, the cutting edges on a multi-knife tool do not all have the same cutting radius. With conventional tool clamping (clearance fit between spindle and tool), only one cutter normally creates the workpiece surface. This is known as a single knife finish. The other cutting knives contribute to the cutting process, but do not determine the finish surface quality of the workpiece. The cutter that projects farthest removes traces of the cutting action of the other cutters.

Finish formation for conventionally clamped tools

Finish formation for high precision tools with centering adaptor

Finish formation for jointed tools with centering adaptor

Quality criteria „waviness“

The visible cutter marks on the workpiece f_{zeff} correspond to a single knife finish (Z = 1). As the cutter mark pitch determines the quality of the workpiece's surface, the feed rate is equivalent to Z = 1 in these conditions.

-> $f_{zeff} = v_f / (n \times 1) \times 1000 = f$

(f = feed per tool revolution)

Multi knife finish

Tool concentric run-out tolerance is significantly reduced by a clamping system that centres the tool on the spindle, such as a hydro clamping system, shrink-fit clamping or HSK. Hydro clamping makes the cutting action of several cutters visible on the workpiece surface. The number and spacing of these is undefined (not regular) because of the remaining run-out tolerance. If the tool is carefully balanced (G 6.3 or better), an adequate finish can be obtained for many applications from this multi knife machining process if the feed rate is high, for example for tongue and groove panel processing or the production of linear mouldings.

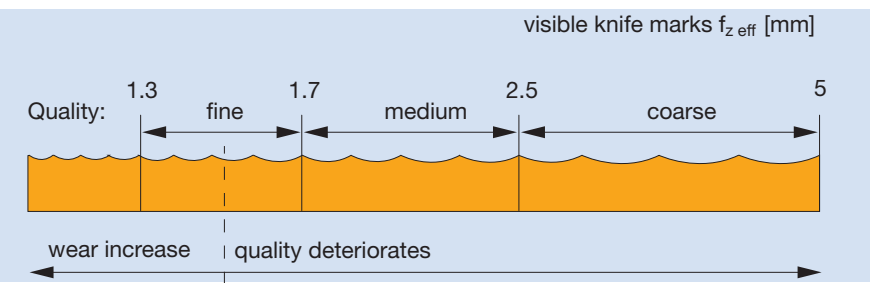

A run-out tolerance of zero can be achieved by subsequently dressing the cutting edges within the µm range known as jointing which is performed at full operational speed on the machine spindle. The knife marks are then at uniform intervals on the workpiece surface. This technology enables the feed rate to be multiplied by the number of cutters, with the quality is equivalent to a single knife finish.

-> $f_{zeff} = v_f / (n \times Z) \times 1000 = f_z$

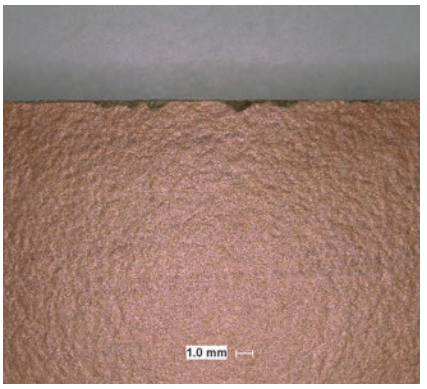

(f_z = feed per tool tooth)

Criteria for the processing quality

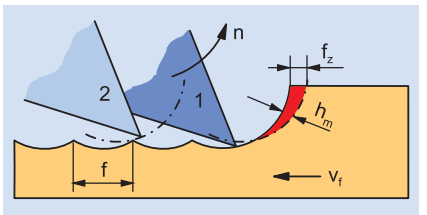

Tool parameters and tool life are measured by the processing quality. For judging surfaces, e.g. during planing, the distance and the depth of the visible cutting actions are decisive. Regarding coated panels, workpiece edges without break outs are important.

The cutting action of the highest protruding edge is responsible for the **distance of the visible cutting actions** (knife marks). The remaining blades produce chips; their start of the cutting angle does not reach the machined surface. Therefore, the jointing technique is in particular used for planing so that all edges process the planed surface to the same extent.

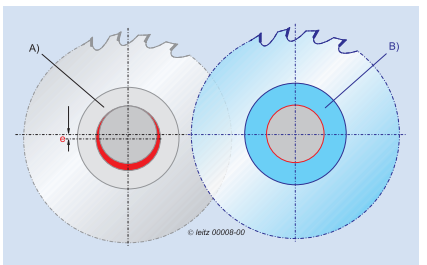

Quality criterion of „break outs“

The tooth feed rate f_z defines the medium chip thickness h_m

$$f_z = \frac{V_f}{n \times Z}$$

Centering tool interface
A) conventional interface with fitting tolerance „e“
B) Centering interface without fitting tolerance
Balancing quality: G = e · w

The **depth of the start of the cutting angle** is determined by the tool diameter and by imbalances and vibrations.

For the quality criteria **tear outs or edge break outs**, the mean cutting thickness h_m is of particular importance. As the mean cutting thickness increases, the woodchips become more stable and tend to break and pre-split. A result is damage to the machined workpiece, that means tear outs or splinters in solid wood and edge break outs in panel materials. Therefore, tooth advance may not be increased arbitrarily. The possible tooth advance depends on the tool diameter and the start of the cutting angle of the tool cutting edges. There are specific guide values for the tooth advance f_z for each workpiece depending on the processing method such as sawing, cutting, planing, finish milling, drilling.

Imbalance and run out tolerances result in different mean cutting thicknesses on the cutting edges of a tool. The thickest woodchips limit the cutting performance. The better the concentric and the axial run-out of the tool cutting edges, the more even the mean cutting thickness of each edge and the higher the possible tooth advance f_z is. With a constant spindle speed n and tooth number Z, this means: Tools with a high imbalance and a small run-out tolerance allow for higher feed rates. At the same time, the higher feed speed is connected with enlargement of the start of the cutting angles with the side effect that further edges (even if with irregular distances) are involved in creating the surface finish. The law of the „single knife finish” no longer applies.

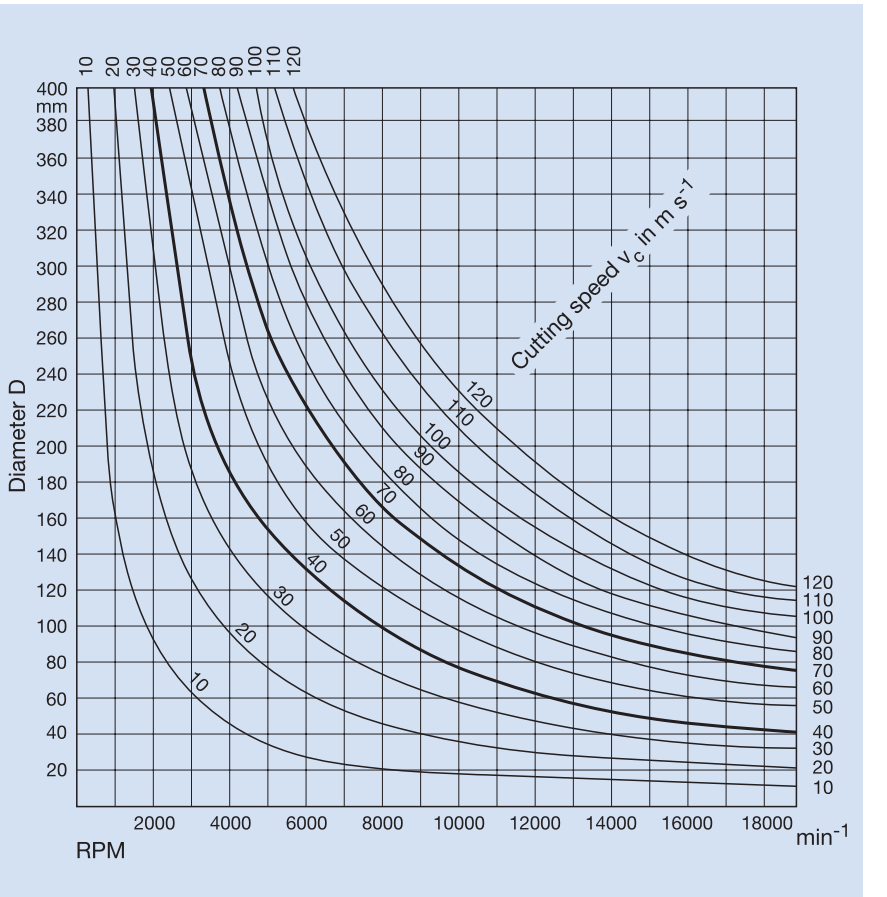

Centred mounting sleeves such as a hydro clamping system, shrink-fit clamping or HSK eliminate the tolerance between the tool and the machine spindle and are required for low imbalance (G 6.3 mm s^{-1} or better) and for accurate concentric and axial run-out of the edges (0.02 mm or better). The tools must be sharpened mounted on this centred mounting sleeve.

If surfaces without tear outs and edges without break outs are a quality criteria and the processed surfaces are flat, then tools manufactured this way may be used for much higher feed speeds compared to a single knife finish. Examples for this include high toothed profile cutters for panel manufacture (laminate panels, tongue and groove boards) which are machined without jointing at feed speeds above 200 m min^{-1} or cutter tools for forming furniture panels which achieve speeds up to 100 m min^{-1}.

When choosing the appropriate machine tool, many interdependent factors must be considered. The goal to achieve a first-class wood surface finish, a saw cut surface without tear outs and an accurate drilling result requires that the cutting material, tool and machine operating data have been adapted to the material characteristics and to each other. Thus, the finished machine tool is the result of analysis and evaluations before the machine is built.

Determination of cutting speed in relation to speed of rotation and tool diameter

The graph shows the cutting speed in m s^{-1} in relation to the speed of rotation and tool diameter. The speed required can be determined if the tool diameter and cutting speed are known. Similarly, the tool diameter can be determined if the speed of rotation and cutting speed are given.

Reading examples:

	D mm	n min^{-1}	v_c m s^{-1}
Circular sawblades	350	6000	110
Cutting tools	160	9000	76
Shank router cutters	52	18000	50

Cutting speed guide values v_c

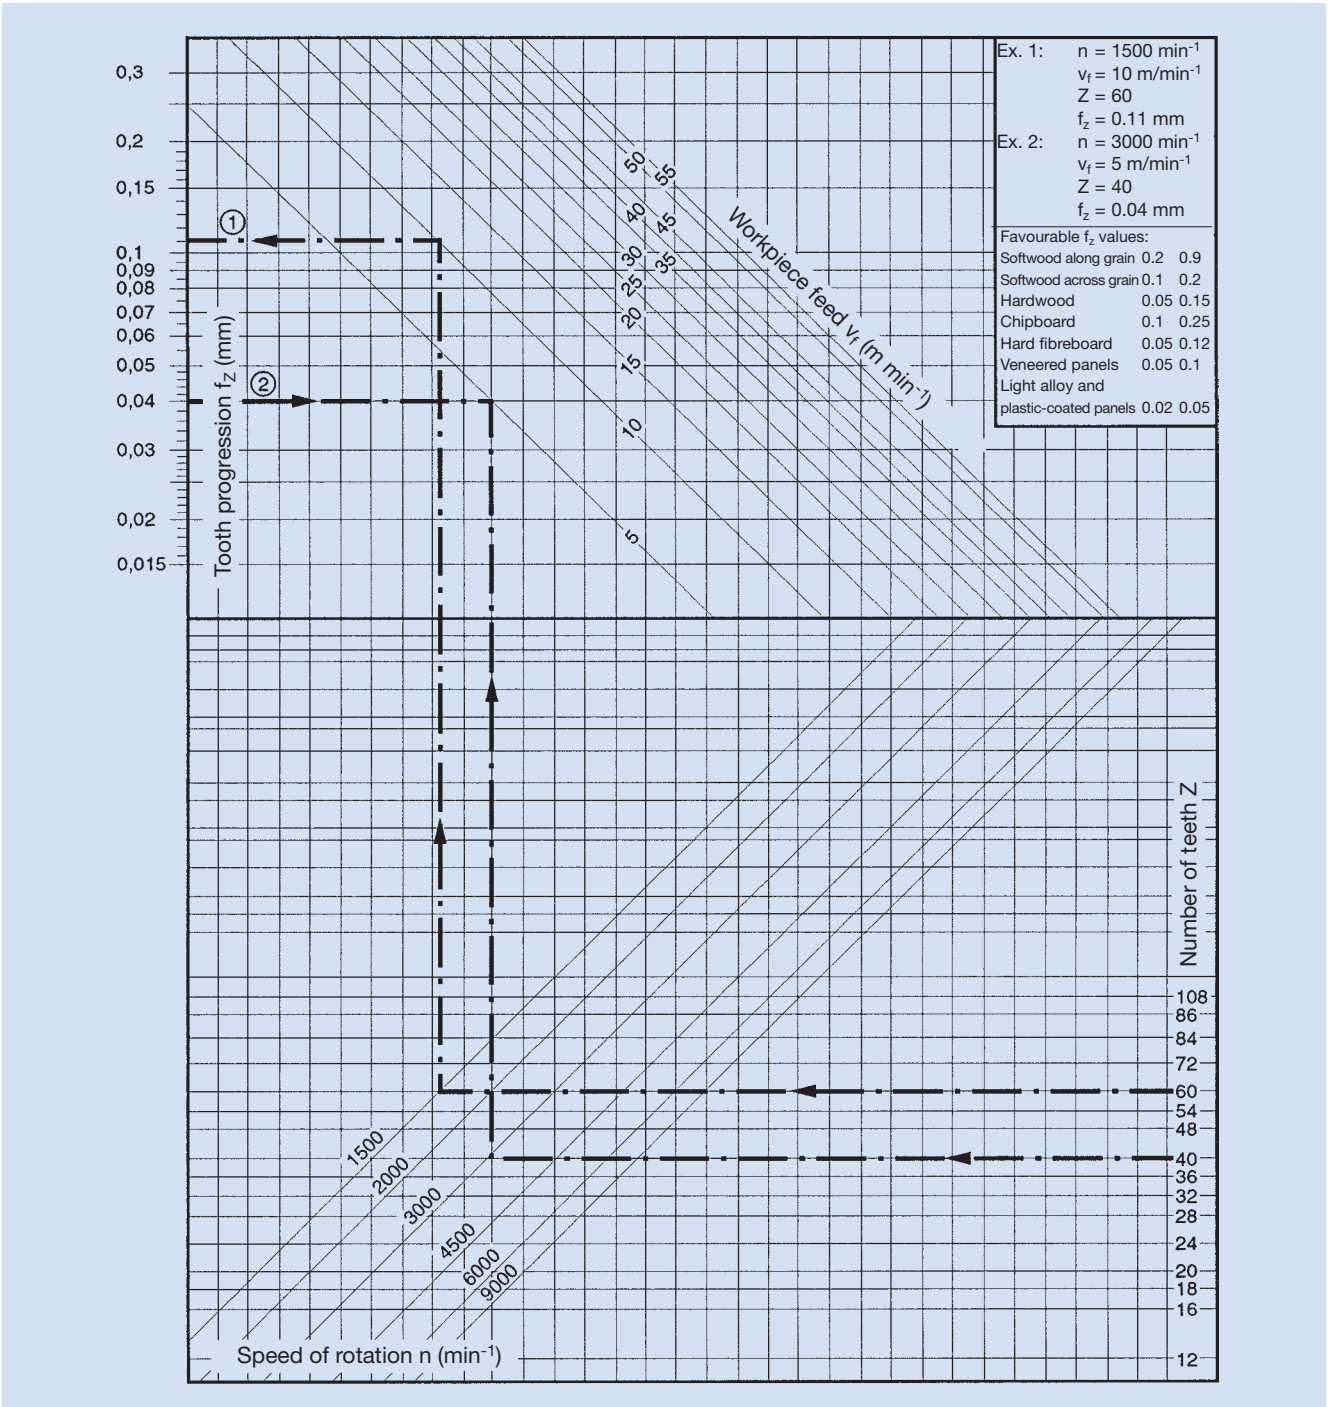

Material	Cutting v_c [m s^{-1}]	Sawing v_c [m s^{-1}]
Softwoods	50-90	60-100
Hardwoods	50-80	60-100
Coreboards	60-90	60-100
Chipboards and fibreboards	60-90	60-90
MDF	60-90	60-90
Panel materials, coated	60-90	60-90
Thermoplastics	40-60	40-70
Thermosets	30-50	40-60
Aluminium	30-60	60-90

The guide values given here apply to tools with a diameter > 100 mm. Regarding shank tools, the recommended cutting speeds are considerably lower due to the small tool diameter and the higher friction (router cutter 10 to 40 m s^{-1}, drill 5 to 10 m s^{-1}).

Tipped tool
Example: HS minifinger cutter

Regarding tool types, the machine tools are distinguished by design and construction design.

Single part tools / solid tools
Solid tools are made from one piece. The basic body and the edges are of the same material. Typical examples of this tool type are profile cutters of HL steel, routers and drills of HS steel or solid tungsten carbide. All have been designed as resharpenable tools.

Profile cutters of HL steel are mainly used for profiling tongue and groove boards in the primary industries. They have a high number of teeth and a very large resharpening area so economical when it comes to high running performance. The one piece design allows for a high precision concentric and axial run-out which is why they can be used for feed speeds up to 200 m min^{-1} without jointing. A key feature of these cutters is the spiral relief in the profile. The free area of the edges is convex and follows a spiral form. The cutting edges are resharpened by turning the tools around its rotational axis. This ensures the wedge angle and cutting profile remain constant.

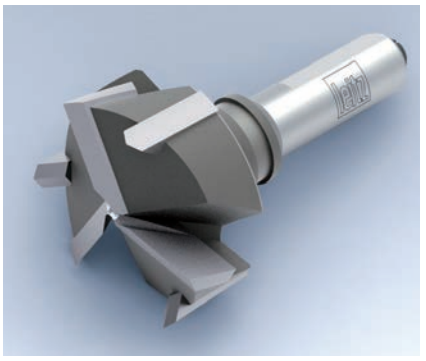

The reasons for a one piece design of routers and drills are different. Because of the small diameters, the most important factor is stiffness which is higher with a body made of HS steel or tungsten carbide compared to tempering steel. More efficient production is also very important.

Tipped tools / progression tools
Regarding composite tools, the edges and basic tool body are made of different materials. They are jointed to each other by brazing or adhesive. Typical examples of this tool type are circular sawblades with tungsten carbide or diamond tips and HS, HW or DP tipped cutters as well as HW tipped drills.

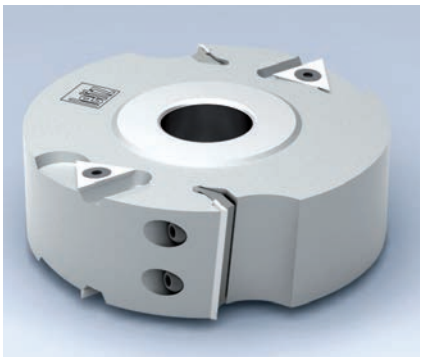

Brazing is at high temperatures between 650°C and 700°C. Due to the tensions occurring when the material is cooling down, the cutting material must have a particular toughness and may not exceed a certain thickness. An adhesive joint has the advantage that it can be done at lower temperatures. In doing so, the joint has less tensions so harder and more wear resistant materials can be used, in particular for tungsten carbide tools.

Tools tipped with HS or HW edges are mostly resharpened on the cutting face. Regarding circular sawblades and grooving cutters, it is recommended to also sharpen on the top surface (relation between face and top approximately 2:1) to maximise the use of the cutting material and to achieve longer tool life. As the free surface has a straight or convex relief, the profile changes slightly when sharpening the cutting face. Regarding glue joint profiles or finger joint profiles, both tools of a pair are always resharpened to the same extent to make sure the joint profiles match each other.

This is not the case with diamond tools. Here, the DP edges with the tungsten carbide support are brazed to the panel seatings so that the thin diamond layer forms the cutting surface.

Tipped tool
Example: HW hinge boring bit

Turnblade tool for jointing and rebating

Profile cutterhead for backserrated blank knives

Profile cutterhead with throwaway knives and turnblade spurs

Resharpening may only be done on the top. As the edges always require a certain projection from the body of the tool, this must be adjusted during sharpening. When sharpening the top, the original profile may be kept. Only the cutting angle is increased.

Closed profiles with a steep run out angle must have a lateral free angle in addition to the radial free angle so that the tool does not „burn". Such tools change their width when being sharpened. So, two piece tool designs are practicable to compensate for the change in profile width.

Cutterheads / assembled tools
Assembled tools are also known as cutterheads since the cutting edges are inserted as detachable knifes. It is distinguished between turnblade knives or throwaway system where the knives cannot be resharpened, and resharpenable knife head systems. All cutting materials may be used. Knife head systems with tungsten carbide cutters are most common.

The advantage of knife head systems is that the tool body design can be reused and only worn knives must be replaced. Assembly and disassembly must be done carefully and under clean conditions to ensure accurate and safe positioning of the knives in the tool. The replacement of the knives is normally by the user, who is responsible for the accuracy and safety of his tools.

The simplest form of assembled tools are the turnblade tools. Standardised tungsten carbide knifes with 2 to 4 cutting edges are used as cutters. When worn, they may be turned 1 to 3 times. The main cutters are normally straight turnblades. For edge processing of rebates or grooves, spur cutters are used and for profile edges, radius or bevelling knives are used. Typical applications are jointing, rebating and grooving tools, but also simple window tools. By separating the profile into many standardised individual blades not adapted to the respective processing situation in respect to their geometry, only a medium processing quality can be achieved, in particular on rounds and profile edges.

Tools with resharpenable knives are, for example, profile cutterheads with serrated back HS or HW knives. These can be resharpened more than 30 times in the profile, keep their profile and are very economical. Furthermore, such systems are very flexible as knives with different profiles can be mounted in one basic body. A disadvantage is the change in diameter so the position of the machine spindles must be adjusted after every sharpening.

Cutterhead systems with throwaway knives do not have this disadvantage. These are normally HW blades. After changing the knives, all tool dimensions stay the same. However, this advantage is gained at the cost of a high consumption of expensive tungsten carbide so such tool systems have high operational costs. In addition, the knife profile is related to the profile of the tool body design. So as is the case with tipped tools, every profile requires a complete tool.

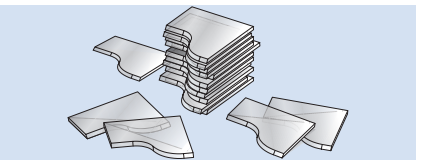

Multi purpose cutterhead with backing plates „VariForm“

A compromise are universal profile cutterheads in which the cutting plates are not support by the tool body design, but by profileable and replaceable supporting plates (example: VariForm). Such systems may be resharpened 2 to 3 times on the cutting surface if a minor change to profile and diameter is acceptable.

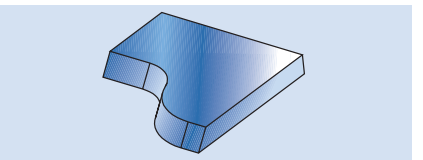

Resharpenable tools

It doesn`t matter if cutters or cutterhead systems, resharpenable tools use the expensive and valuable cutting materials in a more efficient way as throwaway tool systems.

For example a throwaway tool system with 2 mm tungsten carbide cutting edges waste 8 to 10 times more tungsten carbide material in tool life compared to a resharpenable tool system with a 5 mm tip hight. But after every resharpening the dimensions of the tool are changing and a new set up at tools and machines is necessary.

Throwaway tool System (2 mm)
Tungsten carbide consumption by 16 tool lives.

Resharpenable tool (5 mm)

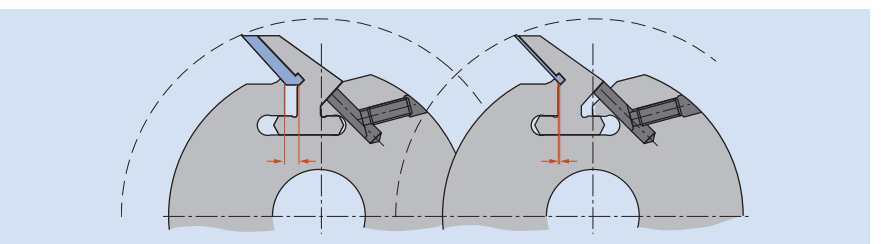

Constant tools

Constant tools combine cost effectiveness of resharpenable systems with the handling advantages of throwaway systems. They are always designed as a cutterhead. A slot guides the knife position parallel to the clearance angle of the profile, so the knife always comes back to the same reference point after sharpening on the cutting face. This ensures that the profile and the diameter of the tool remain constant after sharpening. Adjustment of the spindle position is not required.

Examples for such self adjusting constant tools are the Leitz systems „ProFix“ for profile processing and „VariPlan” for planing.

Constant diameter tool
Example: Planerhead „VariPlan“

Functional principle: ProFix Constant diameter tool

Constant diameter tool
Example: Profile cutterhead „ProFix“

Another form of the constant tool are tools with adjustable knives. They are either adjusted to the diameter when installed (example: planing cutterhead with planer knives) or are moved to the extent of their wear before the sharpening process and then ground back to the nominal diameter (example: jointing cutterhead with cylindrical DP knife insertion).

Typical tooth shapes and applications

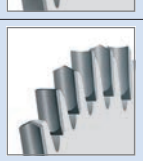

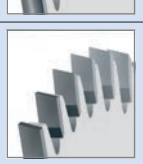

For special applications also sequences of various teeth can be used, combining several types of teeth (e.g. WZ/WZ/FZ). To protect the knife points against breakouts, al tooth shapes slightly can be bevelled (protecting bevel).

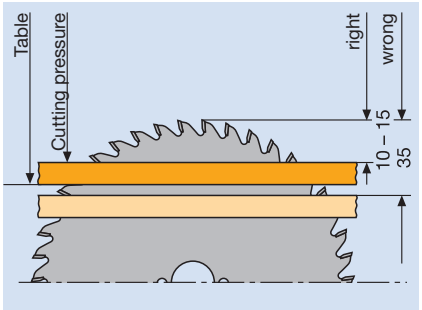

Circular sawblades

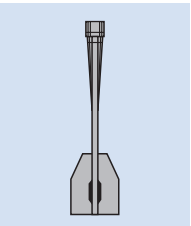

Circular sawblades for processing wood and plastics are progression tools. They consist of a saw plate with tungsten carbide or polycrystalline diamond teeth brazed to its circumference. They are used to separate workpieces. To keep the cutting loss and the cutting forces small, the aim is to keep the cutting width as small as possible. On the other hand, straight cuts free from scores require a certain blade stability; this invariably means a compromise between cutting width and saw diameter.

Depending on the material and geometry of the workpiece, the saw teeth differ in shape and geometry. Generally, positive cutting angles are used to keep the cutting forces low. For thin walled workpieces such as e.g. hollow profiles, negative cutting angles are required to prevent the saw from catching. The number of teeth depends on the requirements for cut quality. The rule of thumb is: the higher the number of teeth, the better the cut quality to be expected, and the lower the number of teeth, the smoother the saw cut.

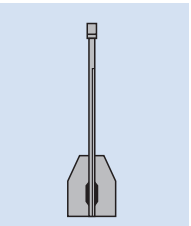

Classification of typical teeth forms and applications:

	Tooth shape	Application
	Flat FZ	Solid wood, along and across grain.
	Alternate, positive WZ	Solid wood along and across grain as well as glued, wood products uncoated, plastic coated or veneered, plywood, multiplex, composite materials, laminated material.
	Alternate, negative WZ	Solid wood across grain, hollow plastic profiles, non-ferrous metal extruded profiles and tubes.
	Square/trapezoidal, positive FZ/TR	Wood products, uncoated, plastic coated or veneered, non-ferrous metal extruded profiles and tubes, non-ferrous metals, Al-PU sandwich panels, hollow plastic profiles, polymer plastics (Corian, Varicor etc.)
	Square/trapezoidal, negative FZ/TR	Non-ferrous metal extruded profiles and pipes, hollow plastic profiles, Al-PU sandwich panels.
	Inverted V/hollow ground HZ/DZ	Wood products, plastic-coated and veneered, coated profile strips (skirting boards).
	Flat, bevelled ES	Construction industry machine saws.

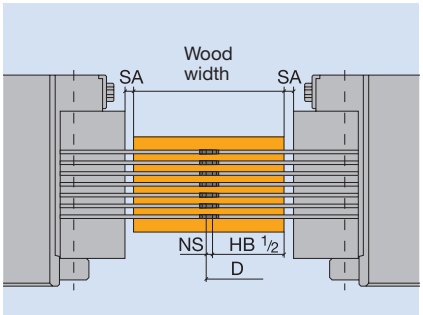

Sawblade without damping

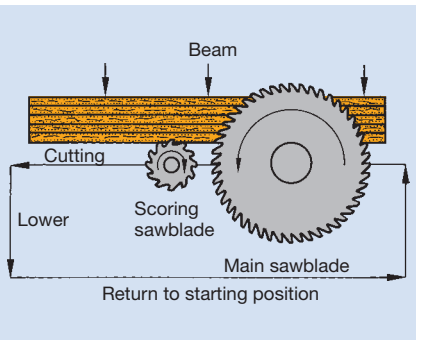

„Foil saw“ with good noise- and vibration damping

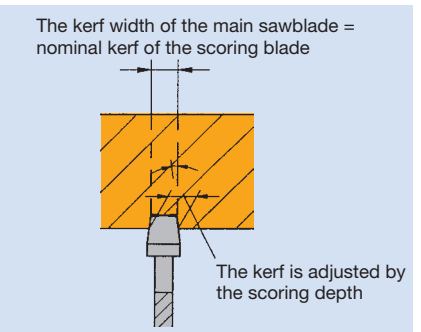

Thin kerf sawblade set to produce parquetry laminates

Inherent to the functional principle, the cutting edges on the tooth entry side are a better quality than the ones at the tooth exit side. By setting the projection of the teeth above the workpiece it is possible to influence the cut quality in certain areas. The point of reference here is a value of 10 to 15 mm. With a greater projection of the teeth, the quality at the exit side suffers, with a smaller projection quality at the entry side suffers. To achieve a cut edge without tear outs on both sides it is required to use scoring saws at the exit side of the main saw. These are sawblades with a small diameter but a greater cutting width than the main saw by 0.1 to 0.2 mm, scoring the workpieces with feed to a depth of 1 to 2 mm. To adjust the cutting width to that of the main sawblade, scoring saws are designed either in two parts or with a tapered tooth shape. Special concave tooth saws have been developed for panel saws without scoring saws; these saws enable cuts without tear outs to both sides when set correctly but have a comparatively short tool life.

Panel sizing machine with scoring unit and pressure equipment

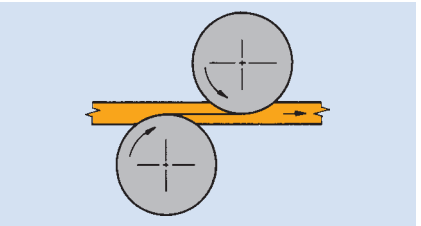

Application scheme of a conical scoring sawblade. Servicing the tools (always in sets), the cutting widthes have to be machted to each other.

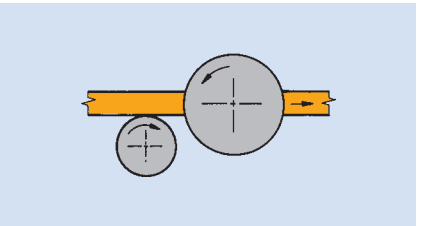

A basic prerequisite to achieve cut surfaces without scoring is a good axial saw run-out but also low vibration. For this, the sawblades are pre tensioned by roll rings so they run stead even when subject to centrifugal forces. Additionally inserted laser ornaments and applied films absorb vibration and at the same time reduce noise. The biggest effect is achieved with foil laminated saws. The noise reduction here is up to 10 dB(A), a noise reduction of half.

Special thin cut saws were developed for separating high quality wood, e.g. when manufacturing parqueting blocks. Depending on the diameter, the cutting width is within a range of 1.0 mm to 1.6 mm. The teeth protude little laterally compared to the saw plate. Their application makes special demands on the woods‘ drying and the workpiece guidance in the machine, in particular the separated segments.

Ideally, circular sawblades should be sharpened on face and top to maximise tool life. For this reason the saw plate must be relieved at the back. As the teeth becoming smaller, the cutting quality improves since the protrusion of the teeth becomes smaller and the tooth vibrates less. However, the gullet also becomes smaller which is why the feed speed must be adjusted.

Double-hogging

Scoring/hogging

Compact hogger
Example: Diamaster DT

Sawblade hogger

In many countries circular sawblades are resharpened only at the face due to sharpening machine limitations. To remove the wear zone, a significantly more sharpening than when sharpening on face and top is required. So, the sawblade may not be resharpened as often.

Hoggers
Hogger means tools that are processing the narrow sides of panel materials with their frontal cutting edges. They are face plain cutters and are used to format panels in through feed machines. To achieve cutting edges without tears you need two tools. There are two different types: „double hogging“ and „scoring/hogging”.

In case of **„double hogging“** a tool cuts with the feed both at the top and bottom of the panel, overlapping in the panel centre. Both tools are aligned accurately at one level and produce a smooth cutting area which may be edged later.

In case of **„scoring/hogging“** the underside of the panel is scored 1 to 2 mm deep (depending on the decorative coating’s thickness) by a scoring hogger with feed and subsequently finished by a hogger from the top against the feed. To avoid edges tearing at the hogger’s blades exiting the wood, the hogger is angled by 0.1 to 0.2 mm axially so that a small step appears on the cutting surface.

In addition to processing narrow edges, the hoggers also have to completely hog the material overhang. For this, the circumference must have a certain hogging width, between 5 to 10 mm for most applications. Regarding the tool design, a distinction is made between „compact hoggers” and „saw hoggers”. In case of compact hoggers all edges are mounted on a basic tool body. Usually diamond tipped tools. In case of saw hoggers a sawblade is screwed to the basic body process the narrow edge while flange-mounted cutters or saw segments hog the remaining material overhang. Usually diamond cutters are used for the sawblade while in most cases tungsten carbide knives are sufficient remove the material overhang.

Depending on the type of decorative coating, a distinction is made between different profile types of the hogger knives, such as e.g. radius or bevel knives or knives with a one sided tip. In recent years, a step profile has been developed (e.g. Leitz Diameter DT), significantly lowering the risk of damage to the knife from foreign matter in the chipboard. There are special shredder knives for processing veneered boards, breaking up the free veneer overhang so that the extraction is not blocked by veneer strips.

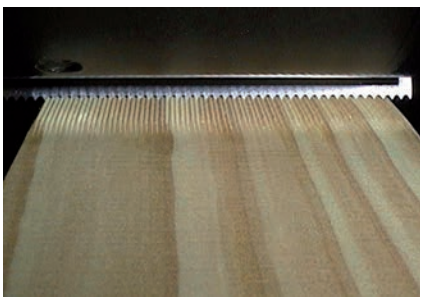

Cutter spindle „CentroStar“

Cutter spindles

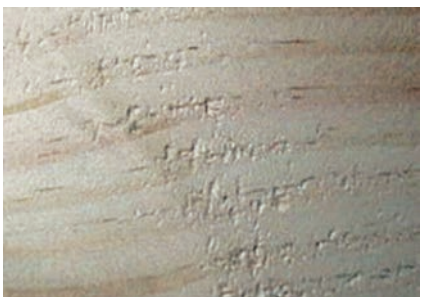

Cutter spindles are tools permanently installed in the machine. They are found mainly in thicknessing and planing machines. They are composite tools with knife replacement always in the machine to reduce down time and ease work on the machine, centrifugal force clamping systems automatically clamp and position the knives when the spindle is run up (e.g. Leitz CentroFix).
Spiral cutter spindles with smooth knives have proven to be particularly quiet. However, such technique can only be used for HS steel knives and not tungsten carbide.

Planing tools

Planing tools are peripheral cutting tools with continuous straight knives. Usually they are designed as planerheads. They are used for smooth surfaces, primarily in processing solid wood. HL, HS and tungsten carbide knives are used as cutting material. The number of blades is between Z = 2 and Z = 36. The cutting width ranges up to a few hundred millimeters.
For precutting, planing tools with segmented edges (HeliPlan) or with ripple profile **(VariPlanPlus/RipTec)** are advantageous. They reduce the presplitting and prevent the wood from an early damage, so that considerably more even surfaces are produced during the enclosed finish planing.

RipTec - preplaning tool

Finish planed surface after conventional preplaning.

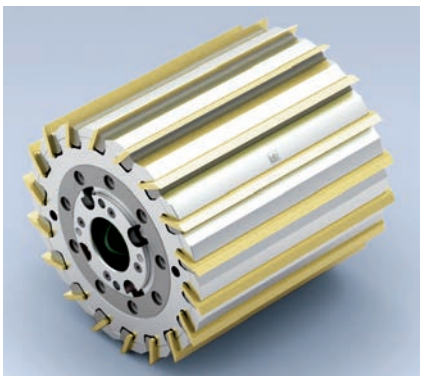

Finish planed surface after preplaning with RipTec.

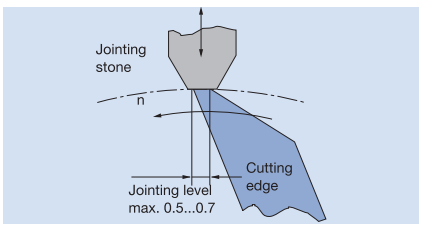

Conventional planerheads have two or four knives and are connected to the machine spindle via a drilling fit. Due to tolerance one knife is decisive for the surface. The feed rates achieved range from 9 to 36 m min^{-1}, depending on RPM. and required surface quality. Planerheads for higher feed rates have a hydraulic clamping or a HSK interface to guarantee a centering of the tool with the machine spindle free of play. For the hydraulic clamping grease-filled chambers in the wall of the tool are pressurized by a grease gun. By expanding the tool chambers, the bore shrinks, and the tool is locked on the spindle. In case of the HSK interface the centring is made by a positive taper lock axially pulled and positioned against a locating face.

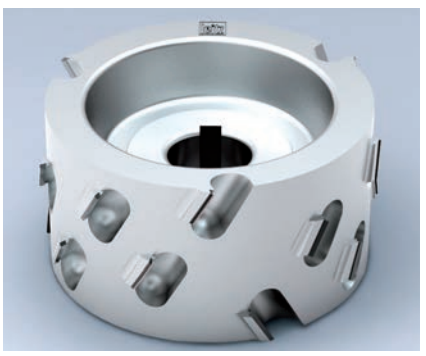

Preplaning tool „HeliPlan“ with HSK

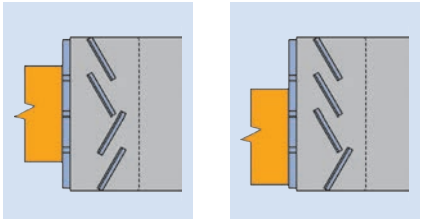

High performance planerhead „TurboPlan“

Jointing of a planerhead

DP jointing cutter

Symmetrical/asymmetrical edge arrangement

By centring a high balancing quality and best possible true knife running is achieved by truing the knives in the machine, **„jointing”**. After jointing, all knives have the same cutting circle and are equally responsible for the surface finish. Feed rates of over 400 m/min are possible.

There are other differences in the way of knife clamping. It is becoming more common for conventional planerheads to use cutting edge systems (e.g. CentroStar or VariPlan) enabling a swift replacement of knives with minimum setup, the hydro planerheads predominantly use systems with planing knives that can be adjusted and resharpened, (e.g. Leitz RotaPlan). There are also tool systems that drastically reduce the high setup effort when replacing the knives. Those include, among others, the Leitz system „TurboPlan” in which all knives are positioned by a positive fit and are clamped simultaneously by hydraulic clamping.

Jointing, grooving and rebating tools

Like planing tools, **jointing tools** cut on the periphery; however, the cutting width is significantly smaller and usually under 100 mm. Jointing tools are designed as turnblade tools or milling tools and are used predominantly in panel processing. The cutting material ranges from tungsten carbide to polycrystalline diamond for industrial use. To protect the edges of the workpiece from tear outs during processing, the knives have shear angles for an angled cut usually the surface. There are **symmetrical and asymmetrical tool designs**. Asymmetrical means that the lower knife row is aligned upwards and all knife rows above it are aligned downwards. These tools are set up with the lower row of knives aligned with the bottom of the workpiece and can process variable workpiece thicknesses within their cutting width in this position. If the angles of the knife rows are aligned symmetrically to the tool’s midplane, the tool must always be aligned with the workpiece centre. When changing the thickness of a workpiece, the tool position must also be adjusted. The advantage of the symmetrical design is that the jointing knives have a slightly convex design and thereby generate a defined concave cut of a few hundredth millimetres on the workpiece. This guarantees a tight glued joint on edge banding machines.

In addition to the peripheral knives, **grooving and rebating tools** have lateral knives, e.g. spurs, or the knives’ sides have a clearance angle. On both sides for grooving tools, on one side for rebating tools. For grooving tools, there are two different types: one part tools (similar to circular sawblades) and two-part adjustable tools for variable groove widths and for correcting the cutting width after sharpening.

Grooving cutterhead, width adjustable

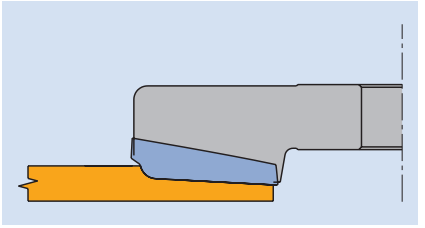

Multi purpose cutterhead „VariForm“

Multi-part ProFix tool set for window profiles

Panel raising tool

Profile tool systems
Profiles range from simple profiles like bevels or radii to decorative profiles to highly complex jointing profiles, such as finger jointing, slot and tenon or counter profiles. Its application is a common across wood processing field. The range of cutting materials is extensive, from HL steel to polycrystalline diamond (DP). The tool types range from solid cutters to brazed tools and profile cutterheads to constant profile tools that can be resharpened.

Multi purpose cutterheads play a special role. Knives moulded in any way may be inserted in a tool body. The blanks may be profiled by a sharpening service or by the user, enabling a quick production of the required plus low tool costs for small production volumes.

For profiles, a distinction must be made between one-sided or open profiles and closed profiles with radial profile shoulders on both sides. While one clearance angle on the profile is sufficient for one-sided or open profiles, the knives must have two clearance angles on the sides for closed profiles. This has consequences in the tool design: such profile cutters must be designed in two parts so that profile changes resulting from resharpening can be compensated. However, turnblade tools that are not resharpened can be designed in one part.

To enable great profile depth it is of advantage to assemble tool sets from several different individual tools of varying diameter. Hence you can use smaller discs and achieve higher speeds. Additionally, the cut distribution can be better adjusted to the workpiece and profile. A classic example is window tools.

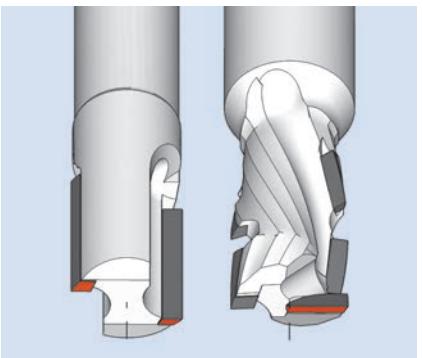

Panel raising tools are a special form of profile tools with profile knives arranged on the face of the tool. They are used to profile the infill panel for doors. Due to the small setting angle κ_r they produce a surface almost without any plane knocks.

Shank tools
Principle, these are the same tool types as for jointing, folding, bevelling, panel raising and profiling cutters but with shank as for drills; they only have a smaller diameter and can be used for higher speeds.

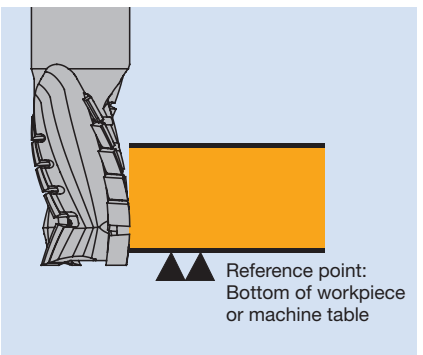

The **routers** are a special case. Usually they have a high **slenderness ratio**, e.g. they are much longer than they are wide. They are mounted in a chuck by their shaft, and the cutting part is outside the chuck. So, the tool is subject to a high bending stress and the breakage due to overstress is high. This is the reason why the **cutter marks f_z** are also significantly smaller than for drilling tools. They are less oriented towards hogging relevant values such as the mean cutting depth h_m but towards the tool's load capacity. This depends on the unsupported length and diameter. This is why, for example, the admissible feed rates for splitting or grooving are usually lower than for jointing.

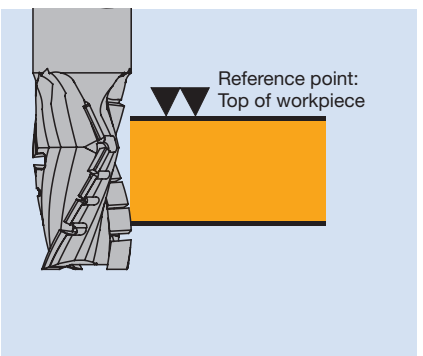

Spiral finishing router in solid tungsten carbide

DP router
left: cutting in end grain
right: plunging tip

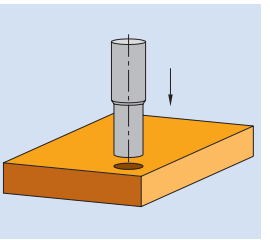

DP-shank cutter with mainly negative twist

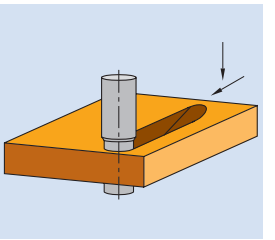

DP-shank cutter with mainly positive twist

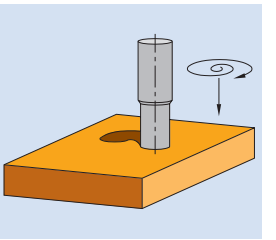

Important design features for routers are the design of the knives and the helix or shear angle. The tool is suitable for axial drilling when it has a basic knife extending to the central axis and if it is designed with a positive helix angle. **Axial drilling** should only be the exception for quality and tool stationary time reasons. It is more gentle for the tool to enter the material by **helical drilling or ramping in** at angle. In such case the requirement for the tool is only a knife front clearance angle, usually the case for routers.

Axial plunging

Plunging

Spiral shaped plunging

The **helical angle** plays another role. An upward positive helical angle favours swarf removal towards the extraction hood and prevents tears on the lower cutting edge (workpiece side at the bottom). A downward negative helical angle applies pressure to the workpiece, supports the workpiece and prevents the upper cutting edge from tearing (workpiece side on top). Routers used for sizing coated panels material have both negative twist in the upper knife and positive twist in the lower area. Hence, top and bottom of the panels are processed without any tear outs. If the proportion with negative twist prevails, the tool can process varying panel thicknesses with the same length set up. If the proportion with positive twist prevails, the dust collection is improved significantly; however, the tool must be adjusted to the relevant board thickness in its axial position.

It is normal for routers that their milling part may be programmed at will. If this results in unfavourable machining situations such as cutting contrary to the fibre direction or exiting the workpiece against the feed, the turning direction must be changed. For this reason most routers have **left hand rotation** in addition to the usual **right hand rotation.**

Tungsten carbide (HW) in solid, tipped, or turnblade or **polycrystalline diamond (DP)** are used as cutting materials. Tungsten carbide tools can be produced with continuous knives and are suited to solid wood processing as finishing tools. Diamond tipped routers always have segmented knives and are mostly used for coated chipboard and fibre materials. It may be that turnblade routers are inferior to solid or tipped tools regarding their feed rates but, their use is justified in cases when constant diameters are important or where it is not possible to sharpen the tools.

For fast roughing (hogging) routers have a **roughing profile**; a wavy profile that is slightly set off at each knife breaks up the chip, and the cutting force is reduced allowing higher speed rates. Special designs with a cascaded profile, the individual steps in total create a straight line, allow hogging processing almost to finish quality. This is the roughing finishing router.

Turnblade shank router

Roughing-finishing router of solid tungsten carbide

Through hole boring bit

Dowel drill

In the aim for more flexible manufacturing with smaller batch sizes, separating boards with router cutters (example: Nesting) is competing against circular saws more and more. Nesting requires small tool diameters of 10 to 12 mm and high feed rates of 20 to 30 m min^{-1}. This makes high demands on the tool stiffness and why tungsten carbide tools are used predominately for **Nesting**.

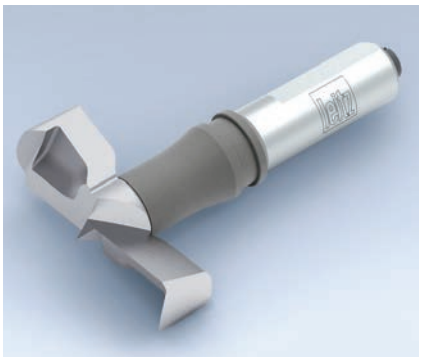

Resharpening of tungsten carbide routers is usually on the cutting face, however, for diamond-tipped routers it is at the edge.

Drills

In principle, drills differ from routers as the knives are only at the end; the periphery is ground circular. They only produce holes with a fixed given diameter. The feed movement is axial.

A distinction is made between drills for through holes, e.g. for screws, and those for blind holes, e.g. for plugs or fittings. Through hole drills have a slim tip to produce entrance exits without tear outs by its scalloped cut. Typical features of drills for blind holes (e.g. plugs or for fittings) are spurs to avoid tear outs at the drilled edge when penetrating the panel, flutes to produce a smooth side, and a centring tip so that the drill is centred when drilling. Ideally, the spurs are formed in a way to apply pressure to the workpiece surface when penetrating and create a pulling cut. Both wood fibres and decorative coatings are cut cleanly before the flutes clear the inside of the drilled hole. Usually the diameter of the flute is reduced by a few decimillimeter right behind the drill tip to reduce friction between drill and drill hole and to help chip removal.

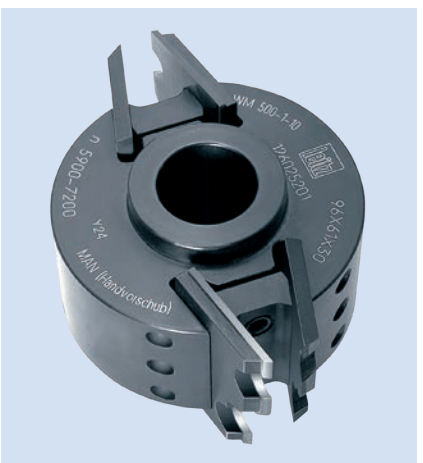

Essentially, drills for solid wood and board material differ with regard to cutting material, helical angle and length. Solid wood drills are manufactured from HS steel or tungsten carbide while it is mainly tungsten carbide and occasionally polycrystalline diamond that is used in drills for panel processing. Since the helical angle is the cutting angle for the drill separating the wood fibre requires a „destructive" cutting edge, solid wood drills have higher helical angles than drills for panel material. The required drilling depths are greater for solid wood applications than for panel material, and the drills are longer. For very deep holes, single edged „Levin drills" are used because their gullet aids chip removal. To avoid the chip choking and creating high frictional heat it may be necessary to clear the cutting space by withdrawing the drill for a short time.

Hinge boring bit

Levin drill

Multi purpose profile cutterhead for manual feed with limitors

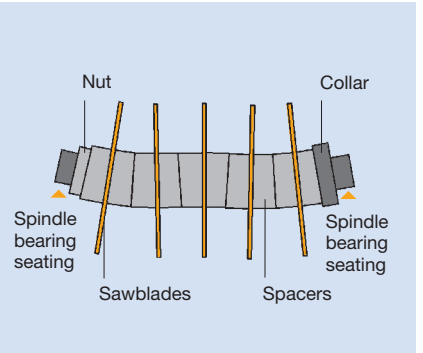

When using drills in drilling units and drilling aggregates, a constant length is important so the drilling depth always remains unchanged. Drills have a screw for adjusting the length at the end of the shank to set the drill length in advance so new and resharpened drills always have the same length. Most drill aggregates have different spindle rotations for design reasons. That is why there are drills rotating left hand and right hand. To reduce the danger of confusion, the two rotations are marked with different colours; drills rotating left hand usually are marked with a red colour, right hand black.

Cutting tools for manual feed
Cutting tools for manual feed must be designed with kickback limitation. They are subject to limitations regarding number of teeth, knife protrusion and gullet. The tool body must either be circular or equipped with limiters restricting the knife protrusion and the cutting gap width.

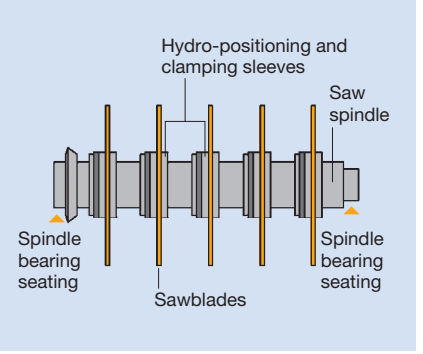

The design details vary with type of tool and are regulated in the European standard EN 847-1 „Machine-tools for the woodworking industry safety demands”. Cutting tools authorised for manual feed are marked „MAN” on the tool.

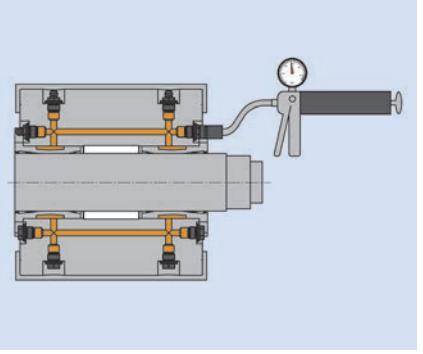

Arbor with detachable spindle/hub connection

Tools on a spindle axially clamped against each other

Hydraulically clamped tools an a spindle not depending on each other

Hydro clamping technology, open system

Tool clamping systems are the interface between tool and machine. They have an adaptor on the tool side and a mounting sleeve on the machine side. The tasks of the tool clamping system falls under three heading categories:

- **Torque transmission**
  The cutting forces must be received with sufficient safety, the tool must not spin.

- **Centring**
  The better a tool is centred on the machine spindle, the better the concentricity and balance quality.

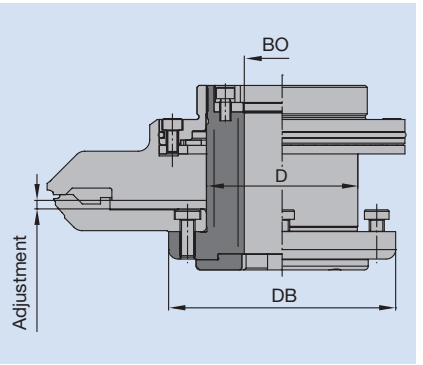

- **Replacing tools**
  The tooling times are shortened by easy and fast tool replacement. Automated tool replacement is required for flexible production.

The simplest form of tool clamping is a shank/hub connection. The tool is centred by means of a defined clearance **fit between tool bore and machine spindle**. Positive fit elements such as feather keys or drive pins transmit the torque. They are clamped by nuts at the shank end. Examples are drilling tools or flanged bushes for motor spindles with splined shank or cylindrical spindles of planing and finger jointing machines. This type of tool clamping has two important disadvantages:

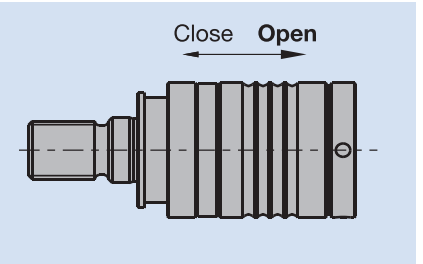

1. The tools are not centred free of play. The centre of gravity is offset by the tolerance, with a negative effect on concentricity and balance quality.
2. If several tools are clamped side by side or on top of each other, the axial run out tolerance of the bodies increases. If the body faces are not parallel. When applying axial tension at the end of the shank, the spindle may bend resulting in an increased imbalance and loading to the bearings.

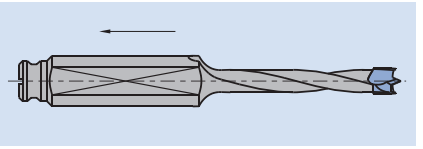

Tool clamping systems that centering free of play were developed to eliminate such disadvantages. One example is **hydro tools** or **hydro clamping elements**. This clamping method consists of a ring chamber around the bore filled with grease or oil. When pressure rises in the chamber, the thin wall concentrically distorts towards the bore. The tolerance becomes zero, and the tool is clamped to the shank. The tools are clamped individually to the shank, there are no clamping forces, and the shank is not bent. Open and closed systems are defined by how the pressure is introduced.

Open systems are filled with grease. The pressure is increased by means of a grease gun. To release the pressure, grease is let out by a bleed screw. Such systems usually can be found in the moulding, planing heads and profile tools. The required pressure of approximately 300 bar is adjusted by the volume of grease pressurised. The system can be used in a wide range of temperatures, important for planing mills.

Hydro-Duo clamping element with two independent chambers for adjustable tool sets

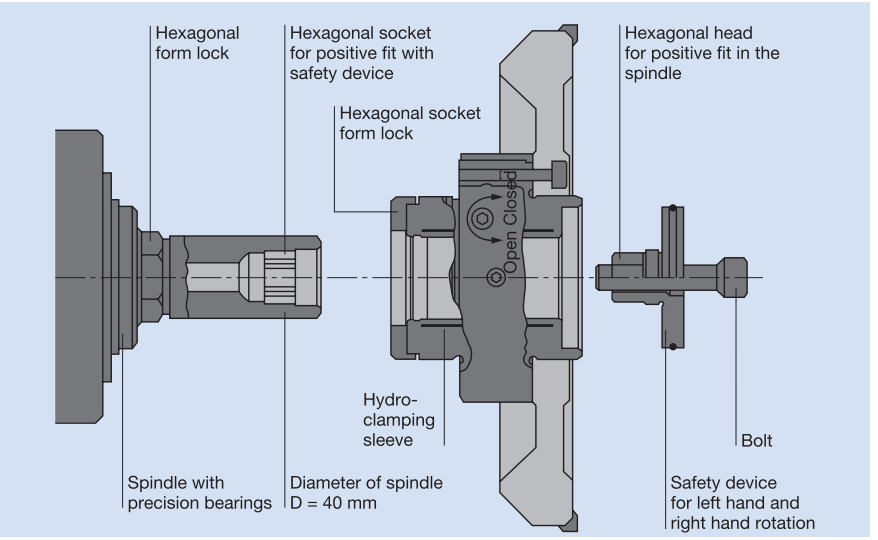

Drill quick clamping system

Tool set with HSK adaptor for automatic tool change

Closed systems are filled with grease or oil. Pressure is built up and released by an internal piston. The pressure is limited by the piston displacement and varies with temperature. Such systems are preferred where workpiece cleanliness is essential, e.g. in furniture, window or floor manufacturing.

Hydro-clamping element, closed system

Hydro clamping elements usually are designed as **„Hydro-Duo clamping elements"** with bi-directionally to center the tool on the clamping element and the clamping element on the shank. Such Hydro-Duo clamping elements are ideal for adjustable two-part slot and tenon tools. When the pressure is released in the outer chamber, a tool part may be moved axially. During the subsequent build up of pressure the tool is centered and clamped again in its new position

As a safety measure against losing pressure, hydro clamping systems additionally are secured mechanically by locking mechanical collars as safety devices against twisting.

To shorten the tooling times for replacing the tools, **quick change systems** were developed for mounting on the machine shank and have a mounting tool flange clamped and loosened in seconds. Examples for this are bayonet mount systems for drilling tools that are operated mechanically or pneumatically or quick change systems that are operated totally tool free, similar to a hose coupling. Despite significantly reduced tooling down time these systems still require a manual intervention in the processing procedure.

Taper mounting sleeves between tool and machine were developed for **automated tool replacement**. Initially they were quick release tapers such as SK 40 or SK 30 but today **HSK interfaces** have expanded globally in wood processing. While initially developed for CNC processing centres, they have arrived in the through feed machine sector, in double end tenoners or planning/profiling machines. The HSK interface incorporates the advantages of both hydro and quick connect clamping systems: precision and speed.

Hydro-strain clamping chuck

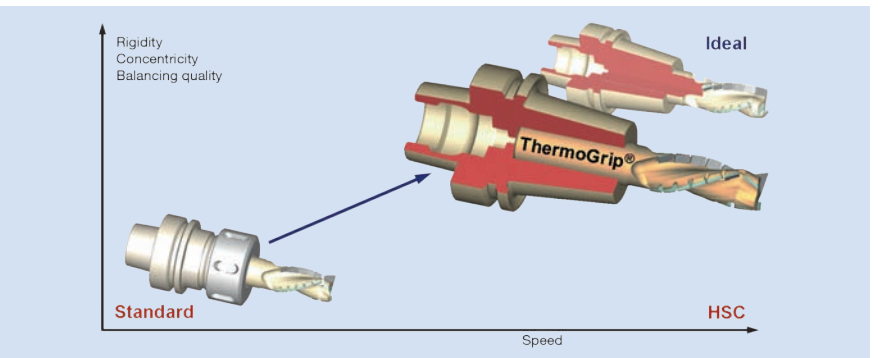

Collet chuck

Shrink-fit chuck ThermoGrip®

Ideally the HSK is designed in one part with the tool. So, the tool diameters can be reduced and speed can be increased. However, in most cases it is not possible for structural or economic reasons. This is why there are HSK adapters that are screwed to the tool. Hydro clamping systems are used again, for a removable and tool centring connection. A distinction is made between hydraulic chucks for drilling tools or multi-part tool sets in which the clamping mandrel is hydraulically opened out, and **hydro clamping chucks** for clamping shank tools.

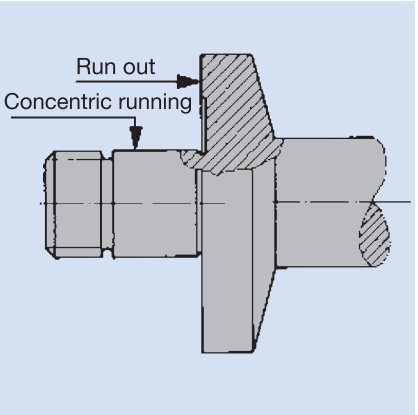

Collet chucks are a universal clamping system for shank tools. By using exchangeable collets, any shank diameter up to 25 mm may be clamped. The multitude of parts and wear on the collet result in moderate values of concentricity and balance quality. Tool excentricity may be up to 0.06 mm. High spindle speeds result in the nut being opened with a loss of clamping force. Consequently, high-quality collet chucks have balanced clamping nuts with an internal ball bearing to produce a higher preliminary tension. On the machine side, the collet chucks are designed with a HSK or taper interface.

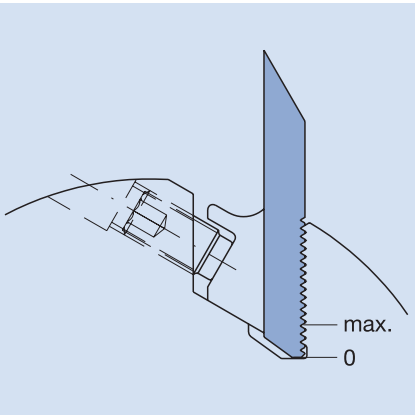

Shrink-fit chucks „ThermoGrip®“ were developed for high performance processing. They create a virtual monolithic connection between tool and chuck. The chuck principle is based on thermal expansion and functions without mechanically moved parts. To insert the tool shank, the clamping part of the chuck is heated. The chuck bore is manufactured undersize expands, receives the tool shank and shrinks while cooling. This way, tool and chuck are connected to each other as one piece. The chuck is heated by induction by special high frequency generators. The chuck's heat expansion is faster than that of the tool so that the tools may be shrunk out again. Shrinking chucks „ThermoGrip®“ may be used at speeds up to n = 36,000 min^{-1}, and due to their stiffness enable 30 % higher feed rates compared to collet chucks even in the conventional speed range up to n = 24,000 min^{-1}.

The same technique of shrinking on tools is also used for arbors for tool sets. It makes sense if the tool remains on the arbor for sharpening or changing knives. A higher balancing quality is achieved by the shrink fit connection since tools and arbor can be balanced as a unit, and the tool weight may be reduced by using light alloy tools. Both result in a considerable increase in the feed speed which increases productivity on stand alone machines, for example in window manufacturing with the wide tool sets usual in this industry.

Highest precision regarding concentric and axial run out and balancing quality is achieved if the tool is sharpened with the clamping system as a unit. This requires universal tool interfaces on the wood processing machines in production and the tool sharpening machines in service. Tools conditioned in this way may be operated at higher feed speeds and have a longer tool life.

Concentricity and run out

Note the readjustment area

1. Measures before commissioning

When installing a tool on the machine, please check the following points:

a) Please read the instructions before commissioning the tool.

b) Clean the tool and the tool adaptor.
All mating surfaces, the knife seating, the interfaces between machine spindle and tool adaptor, must be free from dirt, grease and corrosion.

c) Clamp tools only between the intended clamping areas in the machine. Clamping areas, such as bore, boss, conical surfaces and knife seatings must not be damaged during assembly.

d) The blades must not come into contact with machine parts during assembly – risk of breakage!

e) Check tools for chipped or damaged blades – in particular if the tool has collided with machine parts, such as machine table, tool clamping elements, extraction hoods. Do not use tools that have been deformed. Have damaged tools checked by an expert. Sets containing damaged or worn cutting edges, clamping elements or screws must be replaced with original parts. Tools with a damaged tool body or deformed knife seating must be removed. Repair of such tools is forbidden!

f) When assembling tool sets, use face ground spacers.

g) Tighten all clamping screws with the correct key. The torque specified in the operating instructions must be observed. Using of extensions or hammers not permitted.

h) Check tool tension and feed rate.

i) Check the correct direction of rotation of the tool.

j) Compare the maximum rotational speed (n_{max}) of the tool with the rotational speed of the machine. The value (n_{max}) as stated on the tool must not be exceeded. The rotational speed ideal for the application may be below n_{max}.

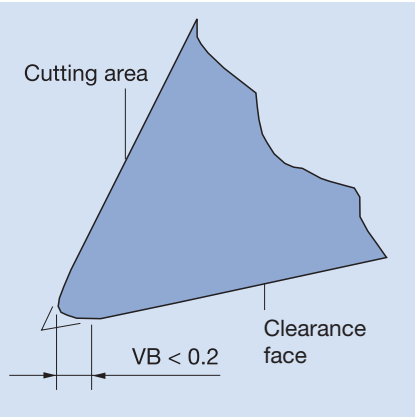

2. Measures to be adopted/care during use

Special care is required to maintain the quality and precision of a tool throughout its life. The following points are important for professional handling of the tools:

a) To prevent corrosion, protect wood processing tools from humidity. If not in use for a long period, the tools should be treated with a suitable care product, such as WD-40 or Ballistol.

b) Protect cutting edges and clamping surfaces from damage. For example, store and transport the tools in their packaging and do not place them on hard surfaces.

Tool wear and cutter condition should be checked during use to confirm the tool is serviceable, and to avoid unnecessary expense. Do not in any circumstances wait until cutter wear (blunting) has become too great or sections of the cutting edge have broken away. On many machines, checking the power consumption with an ammeter is an easy way to monitor the condition of the tool.

Maximum width of wear mark VB.

Cutting generates dust particles which, when mixed with resin or adhesive, can build up on the cutters or in the tool gullets. Such build up reduces the cutting angle, the size of the gullets, increases the power requirement, it shortens the tool life, reduces the surface quality and can, in extreme cases, even burn out motors.

Cleaning tools is not a luxury but an essential part of their use. Tools should be regularly cleaned of resin; special commercial cleaning agents are available. For tools with aluminium bodies, use only commercial cleaning agents with a pH value of between 4.5 and 8, as corrosion can destroy the alloy. Attention: Always comply with the manufacturer's instructions.

Frequent removal of any resin build up is especially important with tungsten carbide sawblades, as even small cutter projections have this problem. In some cases resin build up can lead to cracks in the sawblades.

Particles of workpiece material can damage the cutters if dust and chips are not extracted efficiently. The cutting edges can be chipped, as well as increased abrasive wear.

An extraction system with optimised extraction capacity and performance will help increase tool life.

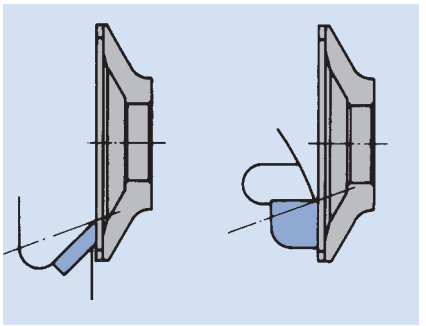

Regular maintenance is essential for proper and safe use of tools.

Tools must be resharpened when:
a) workpiece surface quality is no longer satisfactory
b) the wear mark width (VB) on the clearance face is greater than 0.2 mm
c) the machine's power consumption is too high
d) sections of the cutting edge have broken away.

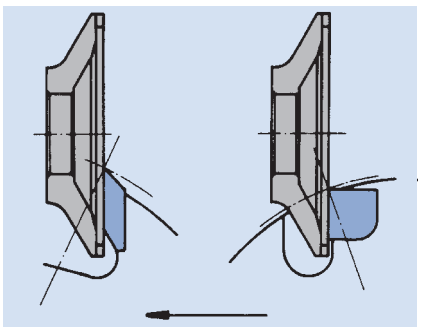

3. Tool servicing/Sharpening
This means reinstating the cutter sharpness of blunt tools, but also other repairs, for example replacing damaged cutting edges.

Servicing differs for the various materials, namely tipped high alloy tool steel, tungsten carbide or diamond.

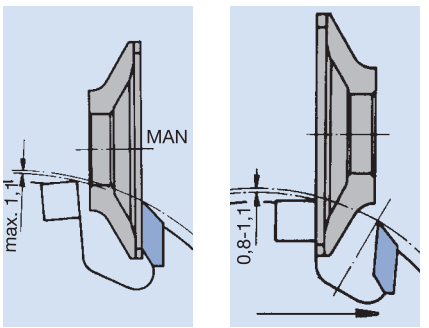

Special machining processes are necessary to minimise the temperature rise in the cutters during sharpening to ensure crack free cutting edges, a cutting geometry according to the drawing, maintenance of the original dimensions and tolerances and a sharp cutting edge.

Sharpening on the clearance face.

Sharpening on the cutting area.

MAN tools: Knife protrusion
in comparison to the limitors.

When servicing tools, the following has to be observed:
– the construction of composite tools must not be altered
– tipped tools must be serviced by trained personnel
– only spare parts to the manufacturer's original parts specification are used
– tolerances to ensure precise clamping, are retained.

To avoid damaging the cutting material by overheating or stress cracking, cooling lubricants must be used when sharpening.
Attention: Dry sharpening is not recommended.
The specified tool body radius should not be changed when sharpening, to avoid the risk of fatigue stresses.

3.1. HL, HS, ST and HW tools (solid or tipped)

HW tools are sharpened with diamond grinding wheels. Corundum or CBN grinding wheels are used for all the other cutting materials listed above.

Basic rules
– clean the tools thoroughly before sharpening
– maintain concentricity tolerances – check with a dial gauge
– spur projection beyond main cutter: 0.3 to 0.5 mm
– cutting edge projection should not exceed 1.1 mm above the limiter on manual feed tools

Tools with radial tipping

a) Grooving cutter with or without spur

These tools are always sharpened on the top, so as not to change the cutting width.

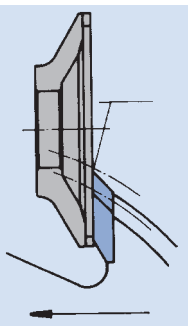

b) Jointing, rebating and bevelling cutter blocks

These tools are sharpened parallel to the face of the cutting edge or the spur.

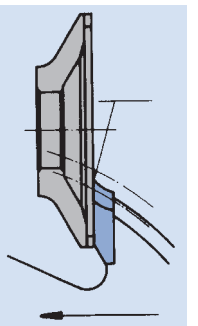

c) Profile cutterblocks

The shape of the tips depends on factors such as the cutting material, profile depth etc. The clearance face can be one of three types (concave, straight, or convex), depending on the purpose of the tool. Sharpening always takes place on the face of the cutter, not on the profile!

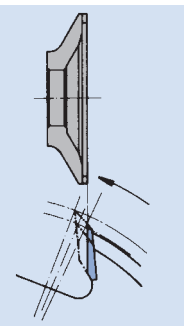

Profile cutterblocks with straight or concave clearance face are sharpened parallel to the face; profile cutterblocks with convex back relief are sharpened by rotating around the cutter axis. The maximum permissible cutting edge projection for manual feed profile cutterblocks (MAN) is 1.1 mm and must not be exceeded.

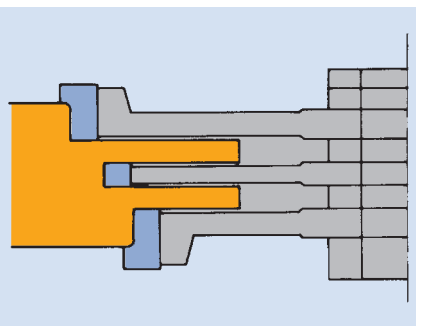

Straight clearance face.

Concave clearance face.

Convex clearance face.

Slot and tenon cutter.

3.2. HS and HW slot and tenon cutters

The special blade tip geometry ensures constant rebate depths if the same amount is ground away from the face of every tip and removed parallel to the tip. For manual feed tools, the maximum permissible cutting edge projection of 1.1 mm must not be exceeded. After several sharpenings, the shimming must be adjusted (with a spacer set) to maintain the profile.

3.3. Cutterblocks and cutter sets

Single tools are sharpened as stated in guidelines 1 and 2 above. The amount removed during sharpening depends on the most worn cutter. All cutterblocks in a cutterset have to be sharpened to the same diameter to maintain the original workpiece profile.

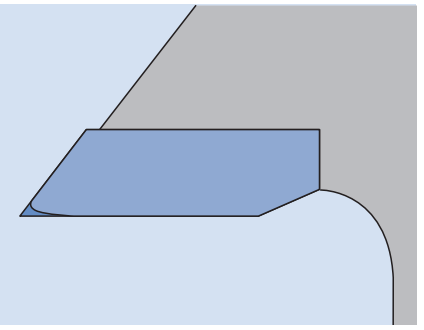

3.4. Diamond tipped tools (DP)

Diamond tipped tools can only be sharpened or eroded on the top, using machines with special fixtures. Sharpening can be either by grinding or by spark erosion. Special measuring equipment is needed to check the sharpened tool. Diamond tipped tools can only be serviced at Leitz service centres with the necessary special equipment, or at the Leitz production plants.

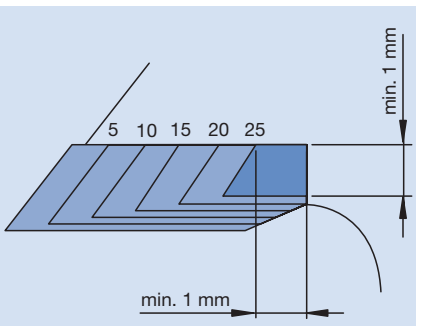

3.5. HW tipped circular sawblades

a) General information

HW tipped circular sawblades should only be sharpened on special purpose automatic sharpening machines. Manual sharpening on universal sharpening machines cannot be recommended for quality and cost reasons. Automatic sharpening machines use a plunge cut grinding principle and are designed for wet grinding. Many of these machines are capable of sharpening all the standard and special tooth forms in a single cycle on both the face and the top. Sawblades must be thoroughly cleaned before sharpening.

Wear on a HW saw tooth.

Leitz recommendation for the remaining tooth size on the sawblade.

b) Reduction of saw plate and body

Only the tungsten carbide tips should be ground by the diamond wheel on automatic sharpening machines; the saw plate must be reduced behind the teeth and if necessary in the chip gullet as a separate operation. To avoid reducing the stability of the teeth unnecessarily, the HW tips should not project more than 0.2 mm (with SB < 3.2 mm) or 0.5 mm (with SB > 3.2 mm) above the saw body.

c) Resharpening

To sharpen a circular sawblade the maximum number of times, it is essential to sharpen both the face and the top of HW circular sawblades. As a rule, the removal ratio between the top and the face is 1:1 for solid wood machining and 1:2 for chipboard. Failure to remove the rounded-off areas at the tip edge completely reduces the tool life. The sharpening machine instruction manual will contain the necessary machine settings. Adjustment to the thickness of the sawblade is especially important, as teeth sharpened inaccurately will cause lateral sawblade runout.

d) Residual tooth height and thickness at end of life

When the tooth height measured from the tip seat is 1 mm, the sawblade is at the end of its life and should be scrapped for safety reasons.

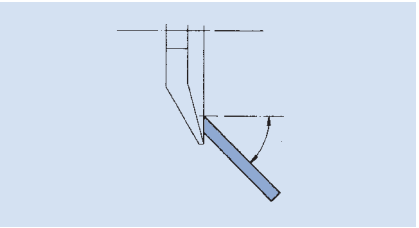

e) Retipping

All Leitz service centres offer a replacement service for individual damaged teeth on HW sawblades. The new tip is applied by induction brazing using the correct braze and flux.
Expert knowledge of both the carbide composition and the saw body material is necessary. Users are recommended not to carry out this work themselves.

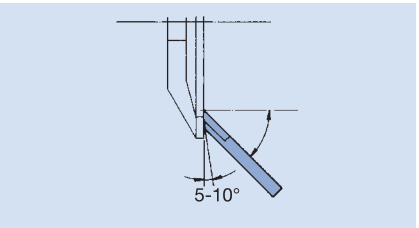

f) Flattening and tensioning

Flattening a sawblade means eliminating any twists in the plate for perfect flatness. Tensioning means stretching the saw plate at a point roughly halfway between the periphery and the centre. Flattening and tensioning are usually carried out as a single operation, and are essential for satisfactory sawblade performance. Sawblades should be checked regularly during resharpening for flatness and tension, and corrected if necessary. This is essential for multi-rip and thin-kerf sawblades, as these work in extreme conditions and can easily crack or fracture as a result. Sawblades severely discoloured by overheating should be discarded.

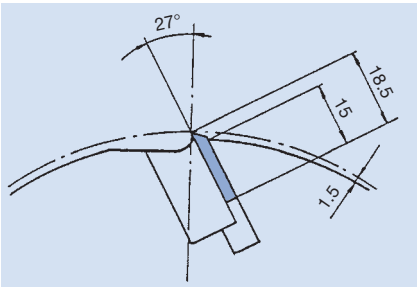

When in use, a sawblade should be supported by the correct flange; the flange diameter is based on the diameter of the sawblade. This relationship is laid down in German Industrial Standard DIN 8083. As a guide, the flange diameter should not be less than a quarter but preferably a third of the sawblade diameter.

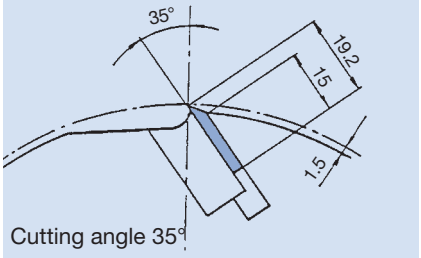

Sharpening of planer knives.

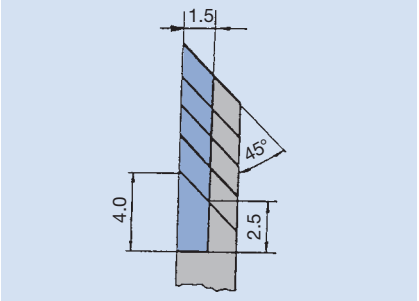

Recessing of the knife basic material of HW-tipped planer knives.

Planerhead
Cutting angle 27°

Cutting angle 35°

HW-tipped planer knives

Allowed minimum dimensions of planer knives.

3.6. Hoggers

a) Hogging cutters

Hoggers consist of a sawblade and a hogging cutter screwed together. Hogging cutters must be ground on the top of the teeth and occasionally on the face, so that the relationship between them and the sawblade is maintained. As the teeth are of equal pitch, it is more efficient if they are sharpened on an automatic machine. The hogging cutter has to be mounted on a special fixture for this operation.

b) Segment hoggers

Segment hoggers consist of hogging segments and a sawblade. The saw segment can be ground either while mounted in the hogger body on a conventional cutter sharpening machine, or dismantled from the hogger body and mounted in a special fixture for an automatic sharpening machine (as used for HW circular sawblades).

c) Compact hoggers

A diamond compact hogger (DP) is sharpened by erosion on all three edges (side, bevel and top), on a special machine. If the tool is mounted on a hydro sleeve during operation, sharpening must be carried out with the same level of clamping to achieve high concentricity and runout accuracy.

3.7. Cutterheads

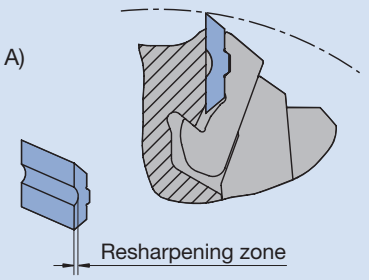

It is essential to follow the below when mounting planer knives:

1) All the tool body locating faces, knives and clamping elements must be clean and undamaged.
2) The clamping screws should be tightened from the centre to the outside (for larger cutting widths).
3) The knife setting should be checked with either a dial gauge or a setting gauge (for planer knives).
4) Do not use an extension to the wrench or key when tightening the bolts or screws.
5) Spurs should sit perfectly in their seats before the screws are tightened.
6) Cutterheads should be mounted on a suitable spindle when tightening the bolts or screws, to avoid distorting the body.
7) Seats and wedges in cutterheads must not be modified in any way as they are specifically designed for maximum safety.
8) All knives and clamping elements should be of equal weight.
9) New knives and clamping elements mounted in opposed seats should have the identical weight to avoid imbalance.

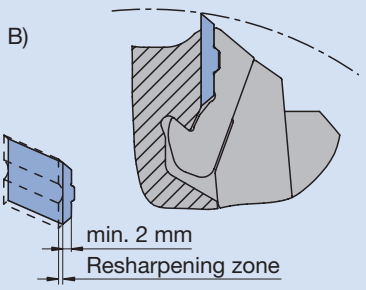

a) Planer knives

HL, HS and HW planer knives are ground only on the back to maintain the original angle. To prevent the diamond wheel from touching the tool body when resharpening the knives, the clearance from the steel backing must be 5 to 10° less than for the actual carbide tip.

Comply with the dimensional tolerances when sharpening planer knives. The minimum clamping width should not be exceeded (see the marks on the side of the tool body).

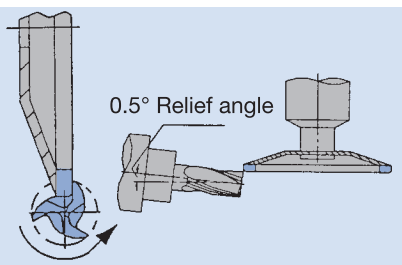

Tungsten carbide turnblade knives in new condition

...resharpened down to the remaining thickness

Sharpening of VariPlan knives.

Infleed through twisting by the tool axis

Sharpening of spiral routers.

For a minimum clamping width of 15 mm and a radial knife projection of 1.5 mm, the minimum knife height is 18.5 mm for a cutting angle of 27° and 19.2 mm for a cutting angle of 35°.
Hydro cutterheads have a radial knife projection of 4 mm; for the same minimum clamping width, the minimum knife height is 21.3 mm.

Note, the minimum tip height must be at least 4 mm on HW tipped planer knives.

b) VariPlan planerhead
The cutter has straight, face-sharpened turnblade knives which can be sharpened. The knives have a raised trapezoidal area on the back and are mounted in a special fixture for sharpening.

The resharpening area of 1 mm is shown by the groove in the knife face. The clearance angle is matched to the clamping mechanism in such a way that after resharpening, the diameter of the tool remains constant and the clearance angle must not be changed.

c) Spiral planerhead
Sharpening the 1 mm thick flexible HS knives requires a special fixture supplied by the manufacturer. After sharpening, the knives are clamped in the cassette to the correct three-dimensional pattern. The user can then install the complete knife cassette in the spiral planerhead.

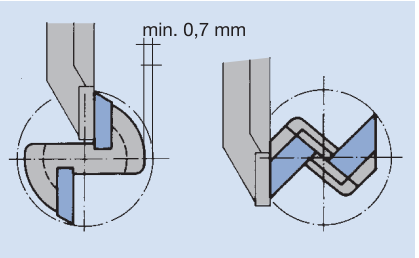

d) Profiled knives
Profiled knives are ground on the edge of the profile; the possible sharpening area and minimum knife clamping heights must be complied with.

The cutting edge quality and the life time can be improved, if one level is ground with a second clearance face, which is about 3° to 5° smaller than the main clearance face. Radial profile sectors additionally require a lateral clearance face.

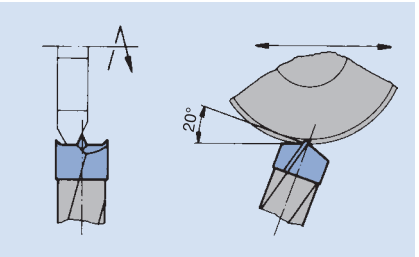

3.8. Tools for routing
a) HS and HW spiral routers
These tools are manufactured in one of two designs: either as a finishing cutter with maximum chip removal of 1 to 3 mm, or as a roughing cutter for high hogging performance.

Roughing cutters are resharpened only on the face because of their special profile. Finishing cutters can also be resharpened on the clearance face.

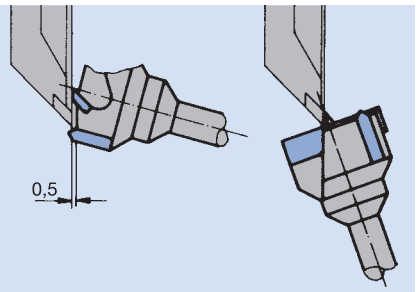

b) HS and HW routers with shear angle
These are face ground. If the cutting edge is chipped, the back can also be ground down to the next possible nominal diameter. The body must be set back at least 0.7 mm from the knife cutting circle.

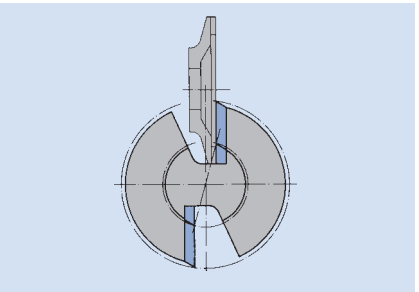

Sharpening of routers with straight edges.

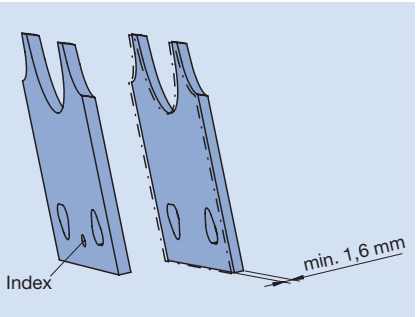

Sharpening of dowel drills.

Sharpening of hinge boring bits.

Sharpening of HW-tipped profile routers.

Sharpening of VariForm knives.

c) HW tipped dowel drills

Clamp the drill firmly in a collet before resharpening, to ensure high concentric running accuracy. HW tipped dowel drills are resharpened on the cutter edge, centre point and spur in one operation with a profiled diamond wheel. The projection of the centre point and spurs above the tool body must be maintained. Profile diamond grinding wheels are available for all frequently used diameters.

d) HW tipped hinge boring bits

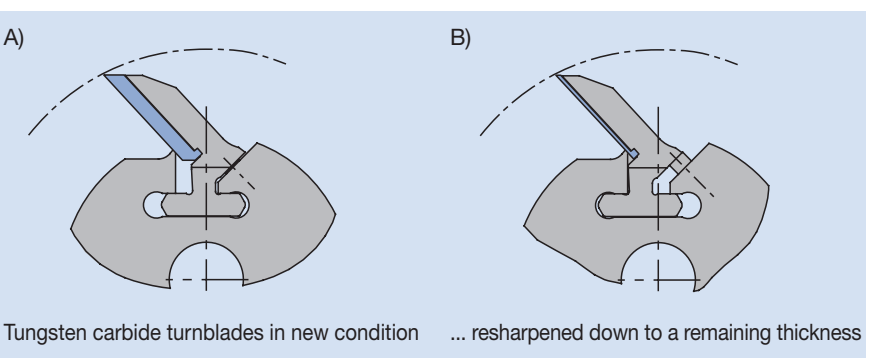

Clamp the tool firmly in a collet before resharpening. The centre point and spurs are ground in a single operation. Before sharpening the edges of the main cutters, the tool body must be set back so that it is 0.5 mm below the main cutter. The spur should project above the main cutter by 0.3 to 0.5 mm; the centre point should project by 1.5 to 2.5 mm. If there is excessive wear, the main cutter can also be sharpened on the face, but only resharpened as far back as the centre of the bit.

e) HW tipped profile router cutters

Profile router cutters are subject to the same sharpening guidelines as profile cutterblocks (see 3.1c). Profiled routers are clamped firmly in a collet before resharpening to maintain high concentric running accuracy. The restricted gullet geometry of MAN tools may require the use of thin, small diameter grinding wheels.

3.9. ProFix knives

HS and HW tipped ProFix knives are sharpened on the face after removal from the tool body and mounting in a pivoting fixture fitted to the table of the sharpening machine. This allows knives with different cutting angles (15°, 20°, 25°) to be aligned parallel to the sharpening direction. HW tips can be ground down to a minimum thickness of 0.5 mm, ensuring a high material utilisation.

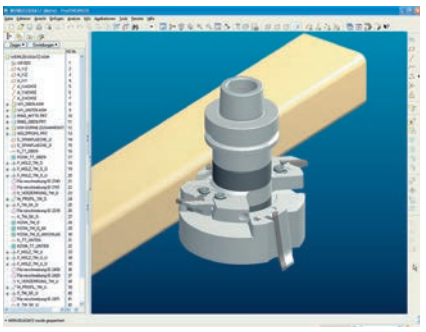

Tungsten carbide turnblades in new condition ... resharpened down to a remaining thickness

Sharpening of ProFix knives

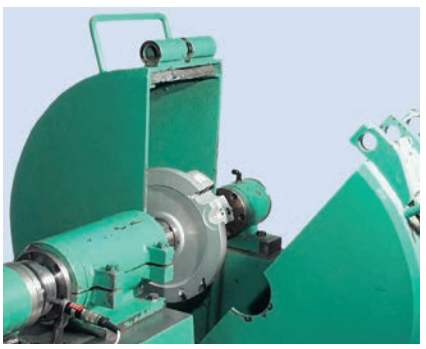

3.10. VariForm profile knives

VariForm cutterheads (HW) are ground parallel with a diamond wheel over the entire front face of the knife (the cutting face).

Special grinding machine fixtures are required; these are installed at Leitz service centres.
The sharpening area is identified by a circular hole in the cutting face. Once this hole has disappeared, the knife has reached the end of its useful Index life and cannot be resharpened any thinner (minimum thickness 1.6 mm).

Modern construction methods through 3D-CAD.

Centrifugation test facility.

Labelling example of boring tools.

Labelling example of shank routers with a minimum clamping length.

Tool with integrated data chip.

Tools for woodworking machines are potentially dangerous because of their high speeds and sharp cutting edges. Always use machine guards and only use tools tested for compliance with the technical safety requirements to reduce the risk of accidents.

Safety at Leitz

The highest level of product safety is important to Leitz as a major tool manufacturer. All Leitz tools are designed and manufactured to EN 847 standards and take the latest safety research findings into consideration. The basis for safe tools is established at an early stage in their development, as can be seen from:

- modern CAD techniques and calculation methods such as the Finite Element Method (FEM)
- extensive testing including overspeed and reversing tests in the Leitz research department
- tool certification according to the independent industrial accident tests laid down by the Deutsche Holz-Berufsgenosssenschaft (German Wood Trade Industrial Accident Insurers).

Manufacturing procedures checked and documented to DIN EN ISO 9001 and a certified quality management system guarantee the high quality and safety standards expected of tools supplied by Leitz. Support from Leitz – including local Leitz sharpening centres satisfy customers' needs and advice from technical specialists – ensures the safety of the tool throughout its life.

Safety in use

A tool is only as safe as how it is used by the operator. Detailed, easily understandable instructions on the safe use of the tools are just as important as their safe design. Leitz cooperated in the VDMA project to develop specimen instruction handbooks for different types of tools. These layouts are now used not only for Leitz products but are also recommended by the European woodworking industry association EUMABOIS.

Users are given the relevant safe handling information by the information etched on the tools, the maximum rotating speed, method of feed, minimal clamping length for shank tools etc.

Intelligent tools with integrated memory chips are available for CNC machining centres. These tools automatically supply the machine control system with the relevant geometry and technology data such as tool length, tool diameter, recommended running speed, direction of rotation etc. The risk of manual input errors is reduced ensuring high operating safety and process reliability.
The comprehensive safety instructions supplied by the machine manufacturer should be followed when using tools. The guards on the machine are to protect people and should not be modified or removed. Internationally accepted pictograms advise of any potential danger.

Safety labels
Pictograms for handling, function monitoring and maintenance - woodworking machines

Important Note:
Tools and clamping tools are not subject to machine guidelines and are no allowed to have the CE-Sign.

Safety guidelines
Leitz and the other well-known German tool and machine manufacturers are members of the Association of German Machine Manufacturers (VDMA). Leitz's long experience has contributed to national and international standards and regulations for the safe construction of woodworking machine tools and for operator safety throughout the world.

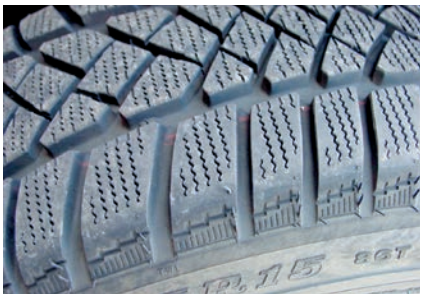

The EN 847 series of European standards, parts 1 to 3 „Machine tools for woodworking – safety requirements" are the most important guideline for European tool manufacturers. Woodworking tools must comply to these minimum standards to be considered safe.

One of the aims of manual feed tools is to reduce kick back. The small gullet size and limited cutter edge projection reduce the severity of injuries. This is evident by the steady reduction in the number of accidents notified annually to the industrial accident insurers.

EN 847-1	Machine tools for woodworking – safety requirements Part 1: Milling and planing tools, circular sawblades
EN 847-2	Machine tools for woodworking – safety requirements Part 2: Requirements for shank milling tools
EN 847-3	Machine tools for woodworking – safety requirements Part 3: Clamping tools

Constant decrease of the „new" accident benefit (source: Holz BG)

Tire profile with irregular pitch.

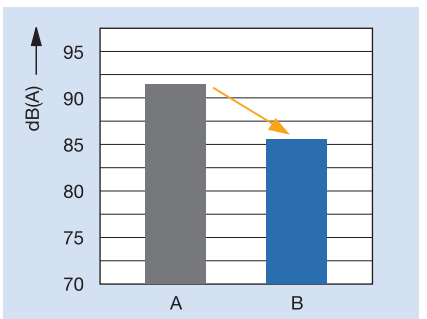

UT-hogger with irregular pitch.

A) Conventional jointing cutter
91,5 dB(A).

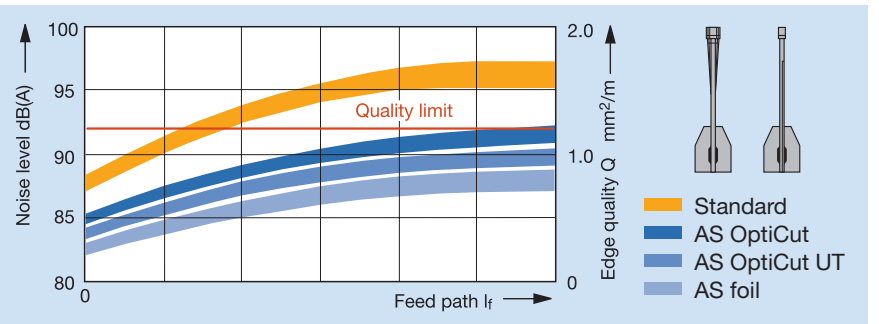

B) Jointing cutter „WhisperCut“
86 dB(A).

Noise reduction for jointing cutters.

In addition to dust, noise is a major problem in the woodworking industry. It is important when developing new tools to reduce noise levels at source and to prevent them from increasing. If the level is lowered by 10 dB(A), the human ear perceives this as a 50% reduction in noise. The latest low noise tool systems considerably improve the users' working environment.

Axial body vibration of a plate type tool such as a sawblade causes noise radiation. The vibration amplitude can be significantly reduced by the design of the teeth, gullet geometry and by damping the saw plate. Leitz supplies a choice of designs of low noise sawblades (AS) which take into account all the criteria, the machine and the materials to be cut.

A) AS sawblade with foil (vibration damping by friction between sawblade and foil)
B) AS OptiCut UT sawblade (irregular pitched teeth supress harmonic vibrations in the sawblade)
C) AS OptiCut sawblade (laser ornaments in the sawblade body reduce natural resonance and vibration disturbing the sound waves).

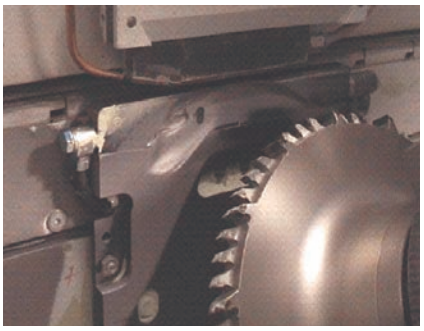

Cutting edge airflow turbulence is another cause of noise as it stimulates vibration in the sawblade. When the cutting tips touch the workpiece, tool and workpiece vibrate. Varying the distance between successive cutting tips counteracts harmonic vibrations and dampens both free running and cutting noise.

The principle of irregularly pitched teeth (UT) is applied to both sawblades and profiling tools.

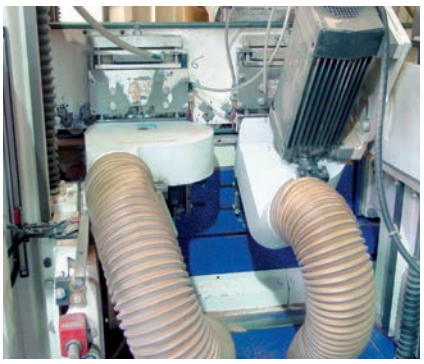

Research has also been carried out on ways to reduce the noise generated by cutting tools. A closed circular tool body shape, a profile that matches the tool body and optimised gullet geometry result in significant noise reduction. Today's diamond jointing tools with these features generate half the noise of their predecessors. But there are other, fully intentional, benefits from noise reduction. Reduced vibration means that the tool runs more smoothly, in turn leading to better cut quality and a longer tool life.

Laminate processing: Typical chip collection in the machine.

Problem: Machine wear through abrasive chips.

Every woodworking production process causes chips, chips to be extracted. Despite state of the art extraction systems, not all the chips are collected. Whether processing solid wood or panels, uncollected chips have a negative impact on added value. They reduce the product quality, make additional tool cleaning necessary, increase machine downtime and can cause machine breakdowns through wear. Leitz's answer to this problem is DFC® (Dust Flow Control).

DFC®

The philosophy behind DFC® is to control the chips by using the kinetic energy in the chip flow to direct the chips away from the workpiece and tool cutting edge into the extraction system.

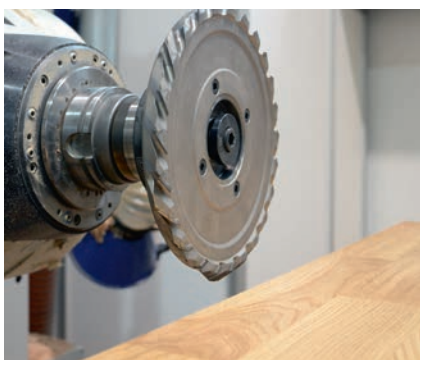

This improved method of chip collection has the following advantages:

– Energy saving
  The extraction airflow no longer has to capture the chips, only transport the chips into the extraction system. This reduces the required airflow volume and, in winter, reduces heating costs, as the heated air is not being taken from the factory.

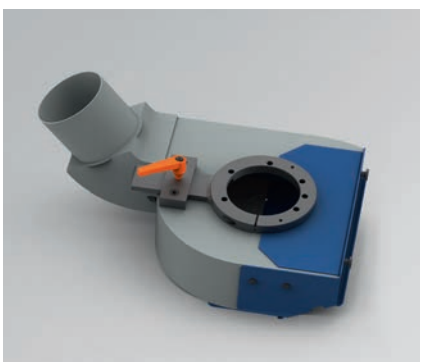

– Improved product quality
  Sensing systems are not impaired in any way by chip imparing them or glue spillage.

– Higher productivity
  Clean machines mean continuous production without stoppages.
  Clean workpieces do not need additional cleaning prior to packaging.

– Reduced servicing costs
  The abrasive chips are directed away from expensive machine elements and dispel their energy against replaceable wear parts such as guides or dust hoods.

DFC® tool for directed chip beam. **DFC®-system:** Tool with adapted extraction hood. Most of the chips are collected and the wear is kept away from the machine.

Module-based DFC® extraction hood with exchangeable wear baffle plates, adjustable tool passage with secondary air supply system and detachable lid for good accessibility to the tool.

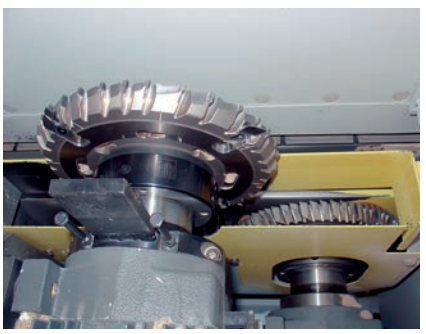

A sound-insulated design can additionally optimize the machine with regard to noise.

Example: Hogging of veneered panels with free veneer projection.

Broken splinters block the extraction hood - fire risk through friction of the rotating tool!

DFC® hogger with shredding edges shred the veneer projection on an extractable size for a complete disposal.

Applications for DFC® tools:
DFC® technology is available for hoggers, jointing cutters, profile cutters, grooving and shank tools; it is the subject of ongoing continuous development. The best results are achieved when the tool and the extraction system are matched to each other. Examples of DFC® system solutions are:

– i-system

  Developed with the machinery manufacturers for efficient chip collection on edge banding machines – over 95% efficient.

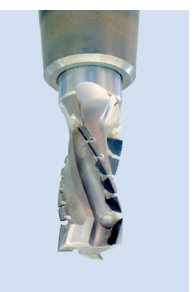

– DFC® tools for laminate and parquet flooring production with matched extraction hoods, e.g. „i-flooring": significant reduce wear caused by abrasive chips to the machine guides and feed systems.

DFC® tools are important in hogging; the problem of continuous high volume chip output cannot be solved simply by increasing the extraction velocity. The chips must be directed as produced in the right direction. The effect cannot be seen so easily as on CNC machining centres when sizing panel materials. Often compromises have to be made in the design of the tool, the working method and chip flow.

Chips can clog the extraction hood and a fire risk from friction with the rotating tool. Chips can also block the extraction pipes and stop production. A well known example is machining veneered panels where the coating projects over the edge of the panel. Conventional tools do not break up the weak projecting coating causing the long strips of veneer to clog the extraction system. Such blockages can cause machine fires. DFC® hoggers with shredder knives solve the problem by breaking the overhang into small, easily extracted pieces.

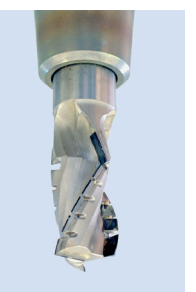

Splitting of worktops with DP-routers. Conventional router: Chip beam horizontally leaves the workpiece and shoots through bristle curtains or vertical blinds.

DFC® router: Chip beam is directed to the top of the extraction hood and can be extraced.

Tool with QR Code

Tool with DataMatrix Code

Tool with integrated RFID Chip

Tool with integrated NFC Chip

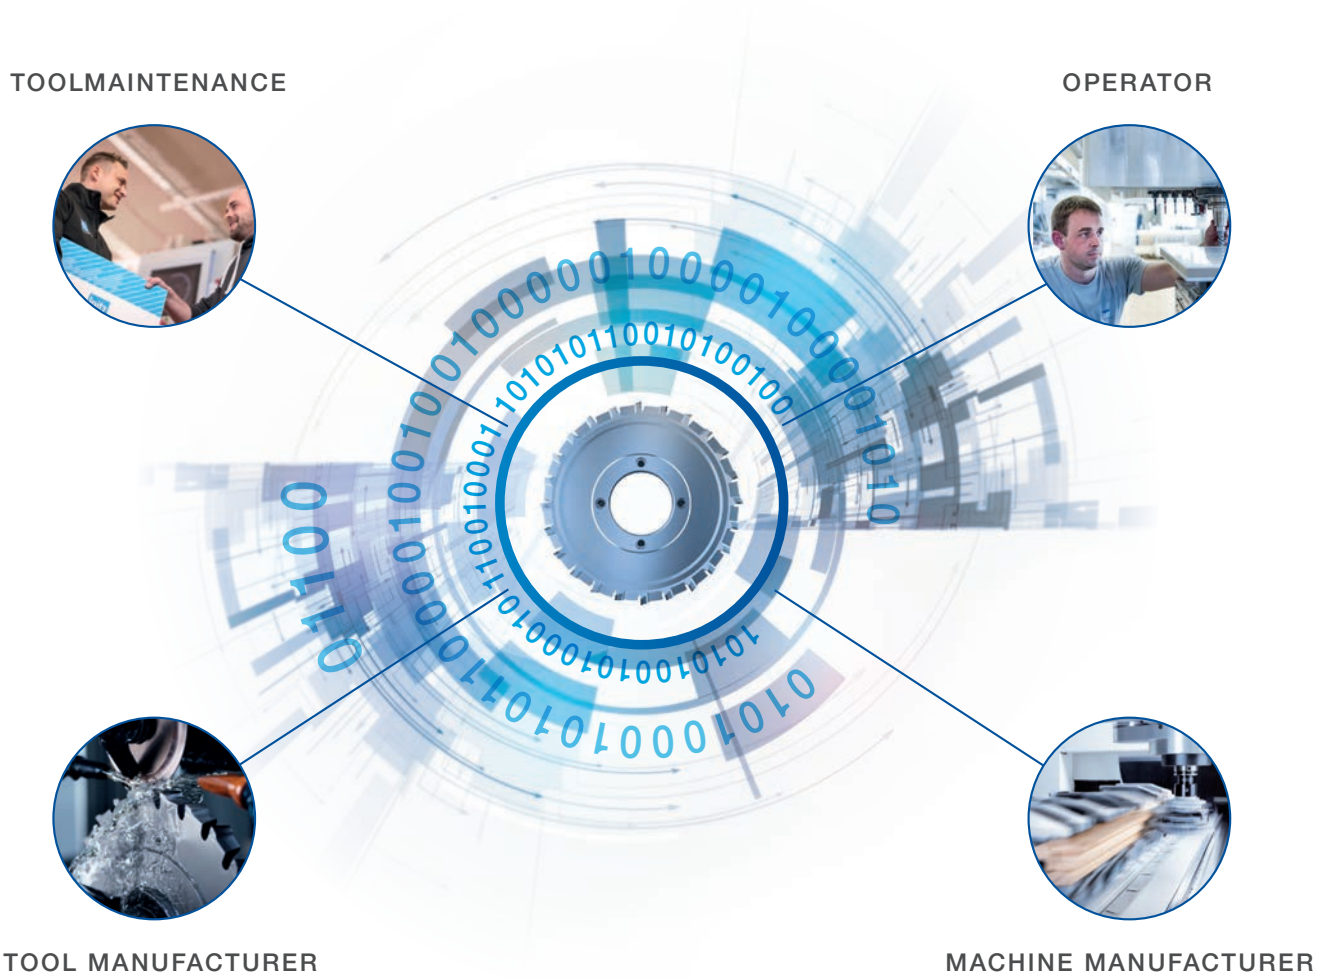

In the early 1990s, Leitz introduced the wood processing market to chip tools as „intelligent tools", storing all a CNC tool machines' relevant data on integrated memory chips. This provided the machine control center with essential geometry and technology data including RPM, direction of rotation, diameter, tool length, reference points coordinates, and if the application was known, even the recommended application speed and feed speed.

The machine transferred all this data in the tool memory device, which had the benefit of needing no calibration, reading the data straight into the machine controls. This improved process safety by preventing errors during adjustment of the machine. However, an issue was the lack of standardization of data; the tool needed to be programmed on a machine-specific basis and could not be used on machines from different manufacturers.

With the rise of digital-controlled manufacturing, cyber physical communication between all operating resources has become increasingly important. For this, tool data is stored in a central database. It is encoded with an automatically readable and unambiguous identification-number: RFID Chips or DataMatrix Codes. Access to the data takes place via this serial number. For manufacturing tool data exchange, a crucial prerequisite is a standardized data model with uniform nomenclature and uniform structure of parameters. The tool acts as knowledge mediator and consequently becomes the key factor for the optimization of the entire production processes and value chains.

The advantage of central data management is that much more information can be transferred; data can be retrieved at any time without physical access on the tool. Not only can tool data be read into the machine control but also machine data like tool life and power consumption can be assigned and written back to the individual tool. In this way a learning system is made possible that anticipates a tool replacement. Pure parameters used by the machine control as well as tool contour data can be transferred to the control unit in order to carry out process simulation and collision detection. By linking tool data with material data and application data, an expert system can be created that recommends the right tool with appropriate parameters to the customer for their machining task.

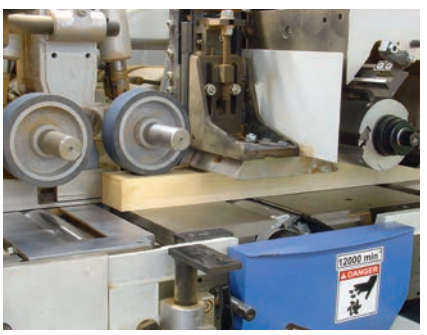

At the highest stage of networking, tool data is provided from the cloud. Access to the data can be assigned to different authorization groups or user groups. Each tool has its individual valid data record which can be updated by the Sharpening Service if tool parameters have changed as a result of resharpening or rework. Tool-related tool life data can be transferred to the tool manufacturer providing the basis for optimizing processes and for pay-per-use billing models.
Imaginable is also a hybrid type between data storage on memory chip and a cloud solution, depends on the existing IT improvement and IT firewall concepts. Here the tool is data medium for necessary safety and performance data and at once other additional information as application parameters, running time parameters or CAD data can be viewed in the cloud.

There are two different categories of wood processing machines with mechanical feed: through feed and stand alone machines.

Detailed view of an edge banding machine with chain feed.

Detailed view of a four side planing and profiling machine with roller feed.

If the workpiece is guided through the machine by a feeding unit, it is called a **through feed machine**. The machining processing is made by guiding the workpiece past the tools. Several tools may be used subsequently, to fully process the workpiece. Depending on the type of feeding systems, a distinction is made between machines with chain feed and machines with roller feed.

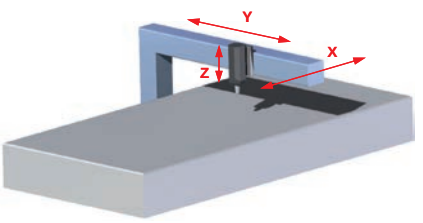

Machines with chain feed are used to process the narrow sides of panel materials. The feed chain is used as the workpiece support and reference height for the process. A revolving top pressure belt clamps the workpieces to the chain and transports them through the machine. The part of the board workpieces protruding past the chain can be processed. The chain's uncoiling movement from the chain wheel, can cause minor variations in the feed; this is called the polygon effect. Such effect is counteracted structurally so that the polygon effect does not affect the processing quality. Typical examples for such machines are double end tenoners and edge banding machines for furniture components or machines for profiling laminate panels or parquet floor panels.

Machines with roller feed are used for four sided processing of solid wood or wood derived products. Typical examples of this machine category are multi spindle four side planing and profiling machines for manufacture of blanks, mouldings and profile panels. The workpieces are pushed along the machine table by driven feed rollers and guided along a fence. The roller feed, is smooth so the wood surfaces are ready for painting. It is also important for the processing quality that the workpieces are guided past the processing tools straight and without vibrations. The tools‘ zero diameter has to be set exactly to the table height and lateral guide in order to produce accurate workpiece surfaces. Constant tools save time since their zero diameter remains unchanged. Additionally sufficient support of the workpieces against the cutting pressure is important in order to avoid workpiece vibrations and rippled surfaces. The pressure shoes at each processing station must be set exactly to the workpiece dimensions. Chip extraction is also important.

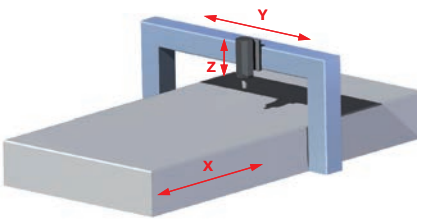

Through feed machines enable a **high production performance** since all processing steps on one workpiece are made almost at once. These machines are designed for bigger batches since retooling is time consuming. Following the **trend towards smaller batch sizes**, elements from stand alone technology are now integrated into feed through machines: e.g. engines with HSK interface, preset tools, automatic tool changer, tracing aggregates, contour milling cutters or through feed drilling. To further increase the feed rates, dynamic linear actuators are used for the tracing aggregates.

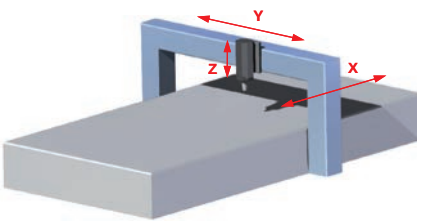

Cantilever type machining centre

Schema of a cantilever machine

Schema of a portal machine

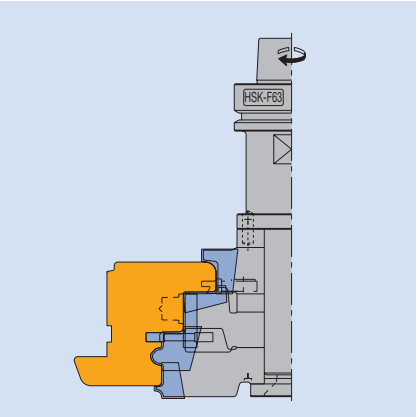

Schema of a gantry machine

In **stand alone machines** the workpiece is clamped firmly, and the feed movement is achieved by contour controlled axis or the workpiece table. Depending on the arrangement for the moving axis, the different designs are called travelling column, portal or gantry. In the **travelling column design**, also called **cantilever**, machine spindle is situated on a mobile cantilever and executes the feeding movements in all three axis. In case of the **portal design**, the machine spindle which is mobile in Y and Z direction is situated on a fixed portal, and the feeding movement in X direction is made by the workpiece table. Such machines often are equipped with tandem tables, so one table may be loaded and unloaded by a handling system while processing is under way on the second. The **gantry design** is a **travelling portal** carrying the machine spindle. All feeding movements are achieved by the tool, similar to the travelling column design. Due to the bilateral support of the travelling portal, the gantry machines are more dynamic than the cantilever machines and often used for the nesting.

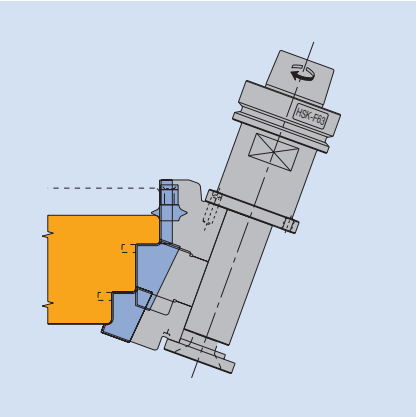

Coming from point-to-point drills and CNC routing cutters, these stand alone machines have been developed into complex **processing centres**. When equipped with drill drives and additional aggregates, they can machine the workpiece, drill it on all sides, saw and even edge band so that a component may be processed in one setting. The machines are made flexible by a tool magazine and automatic tool changer. The main spindle is usually designed to use a HSK interface; HSK-F 63 and also HSK-E 63 are common in wood processing. Since the tool diameters range between 3 mm to over 200 mm, the motor spindles are frequency controlled to a maximum speed of 24,000 min^{-1} or up to 30,000 min^{-1} for HSC machines.

CNC-controlled machines allow flexible component manufacturing with a batch size of one. The software determines what process by which tools. The process task is changed by calling up a new CNC program on the control. Despite this theoretical flexibility, the component spectrum processed on one machine depends on the **workpiece clamping technology**. Beams may be positioned freely and with vacuum extraction clamps for panel workpieces or mechanical clamping devices, for window blanks, may be positioned. Additionally there are vacuum tables for clamping of bigger boards e.g. for nesting. Mouldings without level clamping surfaces, e.g. backrests, are clamped by specially manufactured templates that are set on the beams or vacuum tables mechanically or by vacuum as an auxiliary device. The arrangement and distance of the extraction or clamping devices on vacuum table are very important for the processing result. If the distance is too great, workpiece vibrating reduces the processing quality and tool life. Bigger pieces of waste should be clamped so they do not break off, damaging the tool.

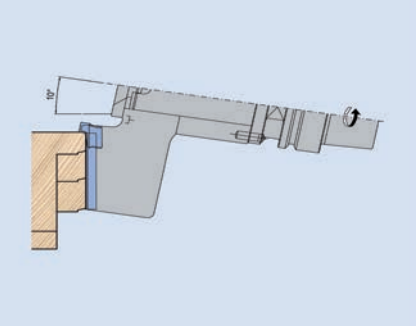

Since all operating sequences on stand alone machines run one after the other the processing times are longer than on through feed machines. On the other hand, any shape can be produced, and the components are finished. To increase productivity various methods are employed. Each machining process is sped up by smaller tool diameters and higher spindle speeds. The movement dynamics are increased by employing linear actuators. By having multiple tools on one arbor, tool changing times are reduced by placing the tool in a different working position instead of replacing it. By using several independently controlled main spindles, operating sequences occurr in parallel. Moving workpiece clamping systems with part transfer enable a workpiece to be fed through the machine.

Rebating with a 3-axis machine

Rebating with swivelled spindle on a 5-axis machine

Taper-surface planing of visible surfaces, for example window profiles: No visible knife marks.

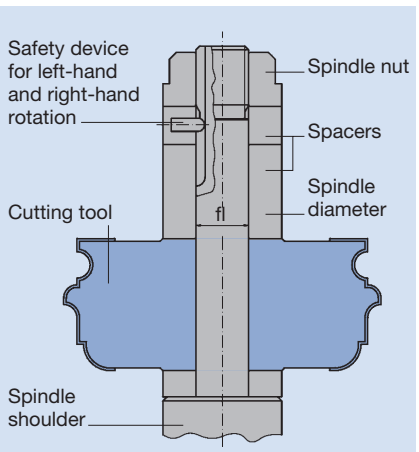

Another trend in stand alone technology are **5 axis machines**. For wood processing machines, the 4th and 5th axis are usually two additional spindle swivelling axis. There are two types: cartesian and gimbal 5 axis machines. Both systems have a vertical swivelling axis for the spindle as a 4th axis. In the cartesian system the motor spindle is rotatable around a horizontal axis in a „fork". In the gimbal system the spindle swivels around an axis by 45°.

A classic application for **5-axis machines** is processing 3D moulded parts, for example model making, mould making or boat building. However, this requires a CAD/CAM interface to program the control the five axis. In wood processing, the trend to utilise the 4th and 5th axis to swivel the main spindle is more widespread. It is possible to minimise the use of aggregates since bevels, saw cuts and holes can be made with standard tools on the main spindle. Additionally the quality of rebates can be increased by the same entry conditions at both sides of the rebate by using a inclined spindle. Tool life of double rebate profiles increased as the tool profile depth is reduced and the differences of cutting speed and operating path of the knives are decreased.

A special application is taper-surface planing, working with small adjustable angles on spindle. Efficient tool diameter can be reached through a big taper angle. This means no visible knife marks on the processed surface.

Manual feed machines are stand alone machines and the workpiece is usually fed by hand. The machine table is the supporting surface for the workpieces. The workpieces are guided past the tool by a sliding table of fence. Workpieces with shaped edges are guided by templates. Special tools with ball bearing guide rings are required. In principle, the same variety of workpieces as on machines with mechanical feed may be manufactured on machines with manual feed. Manual feed machines for one-off products or repair parts are essential in plants for industrial mass production.

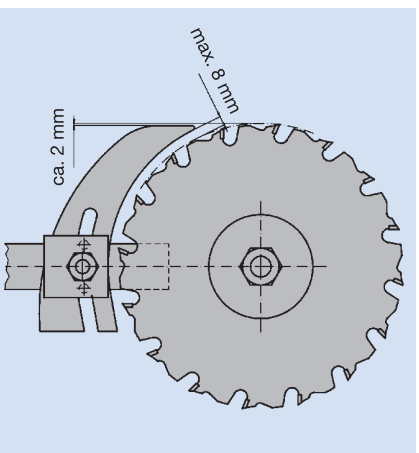

Typical examples of stand alone machines with manual feed are **circular saw benches, surface planing machines** and **vertical moulding machines**. They can be equipped with mechanical feeding devices (power feed) in addition to the manual feed but still are considered manual feed machines.

Example of a tool mounting on a spindle moulder.

The operator creates the feeding movement and is involved in the machining process and is exposed to a higher risk than machines with mechanical feed. The highest risk is the rotating tool since the cutting area is not enclosed. The machine directive for machines with manual feed stipulates numerous protective devices. Their use is stipulated in the national accident prevention regulations, their use is the user's responsibility. Protection against touching the rotating tool, preventing workpiece kickback and dust and noise are covered by the regulations. Extraction hoods have the function of a protective device and at the same time serve as noise protection.

Important safety requirements for working with manual feed machines:
Only tools marked with „MAN" designed with particular kickback limitations to EN 847-1 may be used (except for circular sawblades). The tool mounting on spindle moulders must be effected by a safety against twisting in order to prevent an accidental opening of the tool. The free spindle length has to be filled up with spacers, so that the clamping nut can transfer the clamping power to the tool. To prevent workpiece kickback you have to work against the feed (except for scoring). Short workpieces must be fed by a push stick to keep the hands as clear as possible of the hazard area. Openings between the tool and the machine table or lateral guides must be as small as possible. For stopped straight work stoppers for a defined pivot movement of the workpieces must be attached additionally. Circular sawblades must be operated with a riving knife adjusted to the sawblade diameter and the thickness of the saw kerf to prevent the sawblade jamming in the cut and the workpiece from being thorson back. For cutting edges without tears there are special scoring aggregates scoring the bottom of the workpiece to a cutting depth of approximately 1 mm with the feed before the separating cut is made with the main sawblade. The scoring sawblades create a cutting kerf about 0.1 to 0.2 mm wider than the main sawblade.

Correct adjustment of the riving knife on spindle moulders

Swing cover saw

Plunge saw

Portable router

Typical examples for hand operated electrical tools are circular hand saws and routers. Like stand alone machines they have a „table“ as a supporting surface for the workpiece; however, it is situated above the workpiece since the machine is placed on top of the workpiece.

There are two different designs for **circular hand saws**:

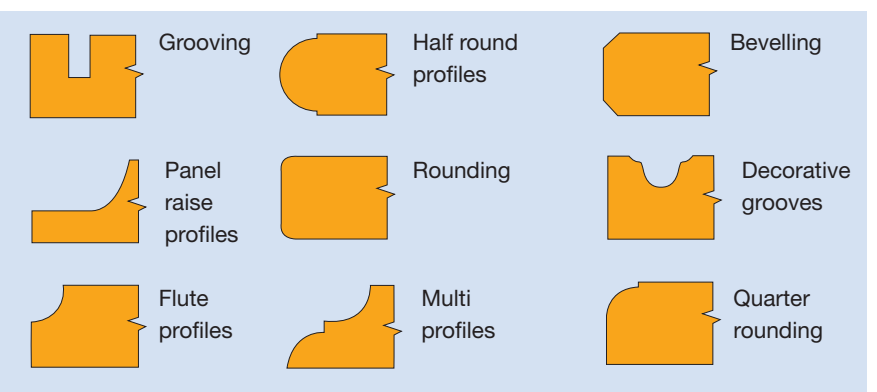

a) Swing cover saws b) Plunge saws

Most wide spread are **swing cover saws** that are usually available for bigger cutting depths. As the name indicates swing cover saws have a swing mounted protective cover that closes automatically after cutting. Plunge saws have a one part stationary protective cover. The complete motor and sawblade unit swivels back into the initial position after cutting so the sawblade disappears into the protective cover with these machines.

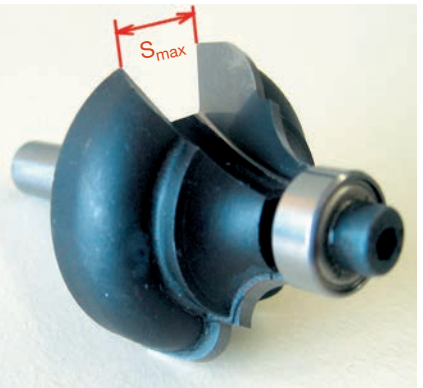

Plunge saws are used when it is necessary to make a plunge cut. On newer plunge saws, the splitting edge is spring loaded to allow for swivelling when making a plunge cut. There are various edge guide and guide rail systems available for circular hand saws, allowing for clean and most of all accurate saw cut. Only use under exceptional circumstances or when making a rough cut.

Usually, circular hand saw machines do not have scoring. A better cutting quality is obtained on the workpiece’s underside. And to achieve a workpiece upper side without tears (teeth exit side) it is recommended to score the top at a depth of approximately 1 mm first and to make the separating cut subsequently with a lateral set off of approximately 0.1 mm.

Hand router machines are versatile machines with almost unlimited uses. The following illustration gives an overview over the most important processing possibilities.

In most instances the tools for hand router machines have bearings or guide surfaces disks to guide the machine along the workpiece edge. Another method is working with templates. This means that a template is mounted in the machine table allowing an exact reproduction by following the contour. Sizing cuts or machining of grooves are best made by edge guides or guide rail systems. Round parts can be created by using a circular aid, similar to a compass.

Cutting tool with guide ring for portable router.

Hand router machines are often used for flush milling veneer or laminates glued to sized boards with an overhang. Router tools with the knife cutting radius equalling the bearing diameter are used. Often no effective extraction is available due to the limited space on hand routers.
When grooving/profiling, chips may be extracted by an extraction pipe.
